# Outline

## Introduction

(concordance cosmology, perturbation theory)

**Discrete picture of (scalar and vector) cosmological perturbations (at all sub- and super-horizon scales)**

(weak gravitational field limit, point-like masses)

**Menu of properties, benefits, and bonuses**

- Minkowski background limit
- Newtonian approximation and homogeneity scale
- Yukawa interaction and zero average values
- Nonzero spatial curvature and screening of gravity

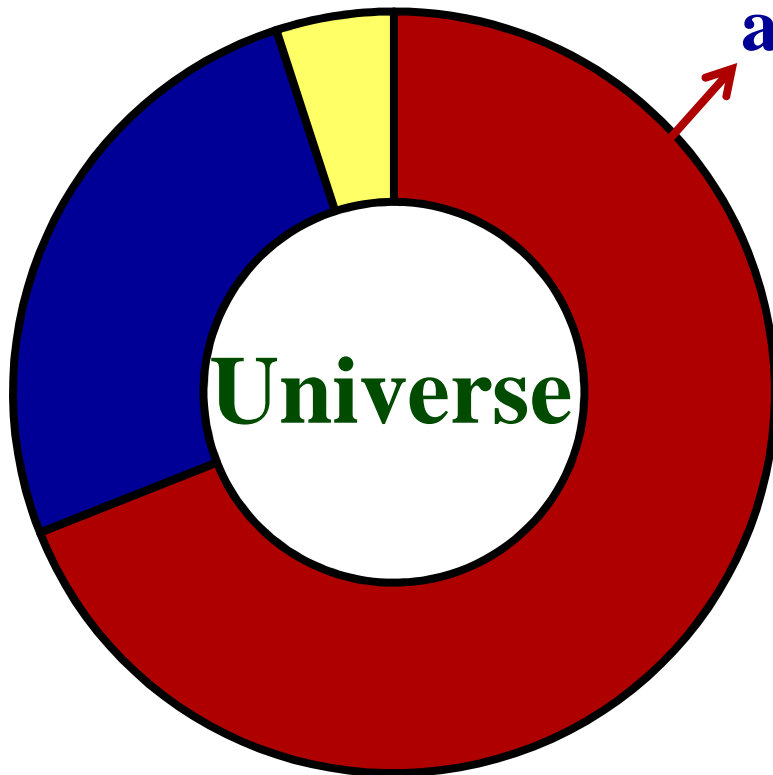

**Conclusion + fun**

# Introduction

Concordance cosmology:  $\Lambda$  C(oldest) D(ark) M(atter) model

acceleration of global expansion

■ ~ 69% ( $\Lambda$ )

■ ~ 26% (CDM)

■ ~ 5% (SM)

(baryons, photons)

Planck 2015 results. XIII. Cosmological parameters [arXiv:1502.01589v2](https://arxiv.org/abs/1502.01589v2)

# Cosmological principle

on large enough scales the Universe is treated as being homogeneous and isotropic

F(riedmann)-L(emaître)-R(obertson)-W(alker) background metric

---

observed separate galaxies, their groups and clusters

structure formation from primordial fluctuations at earliest evolution stages

on sufficiently small scales the Universe is highly inhomogeneous

perturbation theory

## Two main distinct approaches to structure growth investigation

**relativistic  
perturbation  
theory**

**N-body simulations  
generally based on Newtonian  
cosmological approximation**

### Keywords

**early Universe;  
linearity; large scales**

**late Universe;  
nonlinearity; small scales**

**fails in describing  
nonlinear dynamics  
at small distances**

**do not take into account  
relativistic effects becoming  
non-negligible at large distances**

**The acute problem:** construction of a self-consistent unified scheme, which would be valid for arbitrary (sub- & super-horizon) scales and incorporate linear & nonlinear effects.

very promising in precision cosmology era

## Weak gravitational field limit

Deviations of the metric coefficients from their background (average) values are considered as 1<sup>st</sup> order quantities, while the 2<sup>nd</sup> order is completely disregarded.

## A couple of previous attempts to develop a unified perturbation theory

**I. Generalization of nonrelativistic post-Minkowski formalism to the cosmological case in the form of relativistic post-Friedmann formalism, which would be valid on all scales and include the full nonlinearity of Newtonian gravity at small distances:**

**expansion of the metric in powers of the parameter  $1/c$  (the inverse speed of light)**

I. Milillo, D. Bertacca, M. Bruni and A. Maselli, Phys. Rev. D  
92, 023519 (2015) [arXiv:1502.02985v2](#)

## II. Formalism for **relativistic N-body simulations**:

**different orders of smallness given to the metric corrections and their spatial derivatives (“dictionary”)**

J. Adamek, D. Daverio, R. Durrer and M. Kunz,  
Phys. Rev. D 88, 103527 (2013); [arXiv:1308.6524v2](#)  
S.R. Green and R.M. Wald, Phys. Rev. D 85, 063512 (2012);  
[arXiv:1111.2997v2](#)

---

**Discrete cosmology:** presenting nonrelativistic matter as separate point-like massive particles

## Advantages of the unified scheme developed here

- 1) no any supplementary approximations or extra assumptions in addition to the weak field limit;
- 2) spatial and temporal derivatives are treated on an equal footing, no “dictionaries”;
- 3) no expansion into series with respect to the ratio  $1/c$ ;
- 4) no artificial mixing of first- and second-order contributions to the metric;
- 5) sub- or super-horizon regions are not singled out

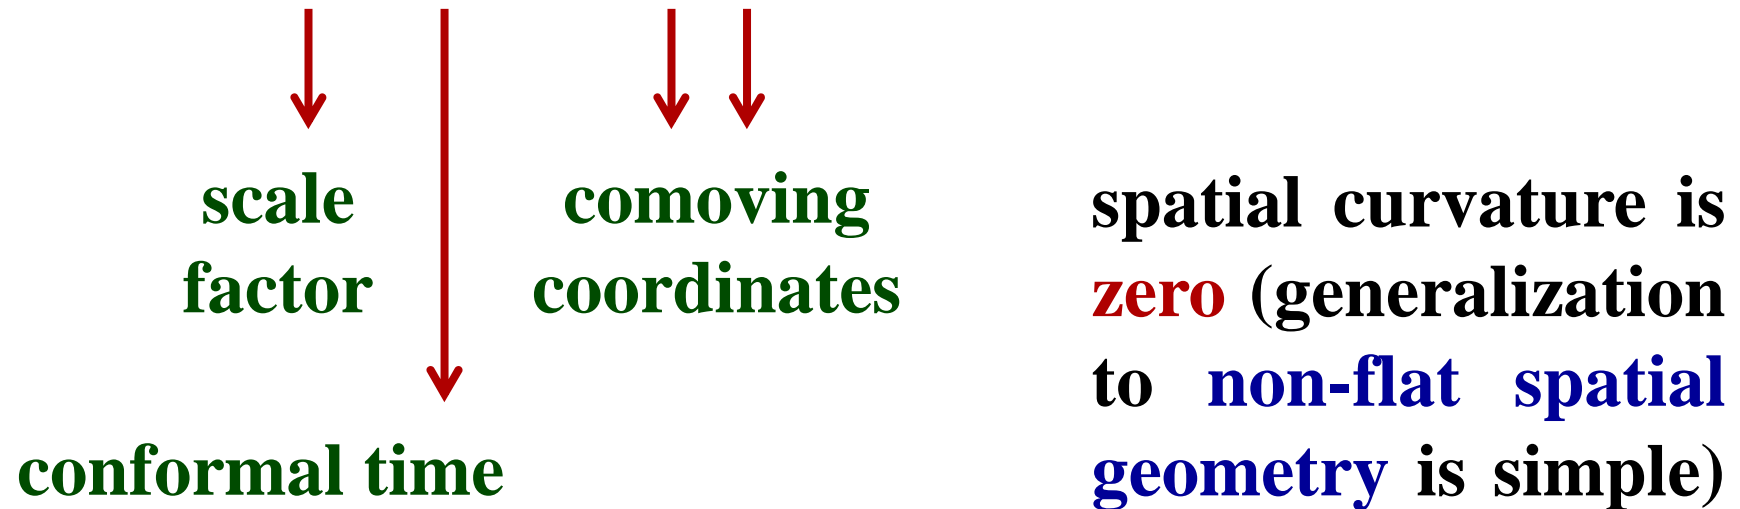

**LET'S  
GO !!!**

# Discrete picture of (scalar and vector) cosmological perturbations

Unperturbed FLRW metric describing (homogeneous and isotropic on the average) Universe:

$$ds^2 = a^2 (d\eta^2 - \delta_{\alpha\beta} dx^\alpha dx^\beta) \quad \alpha, \beta = 1, 2, 3$$

# Friedmann Eqs. in the framework of the pure $\Lambda$ CDM model (with a negligible radiation contribution):

$$\frac{3\tilde{H}^2}{a^2} = \kappa\bar{\mathcal{E}} + \Lambda$$

**energy density of  
nonrelativistic  
pressureless matter**

**overline:** average value ;  
**prime:** derivative with  
respect to  $\eta$

$$\frac{2\tilde{H}' + \tilde{H}^2}{a^2} = \Lambda$$

**cosmological  
constant**

$$\tilde{H} \equiv \frac{a'}{a} \quad \kappa \equiv 8\pi G_N / c^4$$

**Newtonian  
gravitational constant**

## Perturbed metric describing (inhomogeneous and anisotropic) Universe:

$$ds^2 = a^2 \left[ (1 + 2\Phi) d\eta^2 + 2B_\alpha dx^\alpha d\eta - (1 - 2\Phi) \delta_{\alpha\beta} dx^\alpha dx^\beta \right]$$

**function  $\Phi(\eta, \mathbf{r})$  and spatial vector  $\mathbf{B}(\eta, \mathbf{r}) \equiv (B_1, B_2, B_3)$ :**  
**scalar and vector perturbations, respectively**

$$\nabla \mathbf{B} = \delta^{\alpha\beta} \frac{\partial B_\alpha}{\partial x^\beta} = 0$$

**tensor perturbations are  
not taken into account**

**Einstein Eqs.:**  $G_i^k = \kappa T_i^k + \Lambda \delta_i^k \quad i, k = 0, 1, 2, 3$

**mixed components of Einstein and  
matter energy-momentum tensors**

$$G_0^0 = \kappa T_0^0 + \Lambda \Rightarrow \Delta\Phi - 3\tilde{H}(\Phi' + \tilde{H}\Phi) = \frac{1}{2}\kappa a^2 \delta T_0^0$$

$$G_\alpha^0 = \kappa T_\alpha^0 \Rightarrow \frac{1}{4}\Delta B_\alpha + \frac{\partial}{\partial x^\alpha}(\Phi' + \tilde{H}\Phi) = \frac{1}{2}\kappa a^2 \delta T_\alpha^0$$

$$G_\alpha^\beta = \kappa T_\alpha^\beta + \Lambda \delta_\alpha^\beta \Rightarrow \Phi'' + 3\tilde{H}\Phi' + (2\tilde{H}' + \tilde{H}^2)\Phi = 0$$

$$\left(\frac{\partial B_\alpha}{\partial x^\beta} + \frac{\partial B_\beta}{\partial x^\alpha}\right)' + 2\tilde{H}\left(\frac{\partial B_\alpha}{\partial x^\beta} + \frac{\partial B_\beta}{\partial x^\alpha}\right) = 0$$

$$\Delta \equiv \delta^{\alpha\beta} \frac{\partial^2}{\partial x^\alpha \partial x^\beta}$$

**Laplace operator in  
comoving coordinates**

$$T_i^k = \bar{T}_i^k + \delta T_i^k$$

$$\bar{T}_0^0 = \bar{\epsilon}$$

**only nonzero average  
mixed component**

**gravitating masses**

$$T^{ik} = \sum_n \frac{m_n c^2}{\sqrt{-g}} \frac{dx_n^i}{d\eta} \frac{dx_n^k}{d\eta} \frac{d\eta}{ds_n} \delta(\mathbf{r} - \mathbf{r}_n)$$

$$g \equiv \det(g_{ik})$$

**comoving  
radius-vectors**

$$\rho = \sum_n m_n \delta(\mathbf{r} - \mathbf{r}_n) = \sum_n \rho_n \quad \rho_n \equiv m_n \delta(\mathbf{r} - \mathbf{r}_n)$$

**rest mass density**

**in the spirit of the particle-  
particle method of N-body  
simulations**

**4-velocities**

$$u_n^i \equiv dx_n^i / ds_n$$

**comoving  
peculiar  
velocities**

$$\tilde{v}_n^\alpha \equiv dx_n^\alpha / d\eta$$

$\tilde{v}_n^\alpha$  import the 1<sup>st</sup> order of smallness  
in rhs of linearized Einstein Eqs.

$$\delta\rho \equiv \rho - \bar{\rho}$$

$$\delta T_0^0 \equiv T_0^0 - \bar{T}_0^0 = \frac{c^2}{a^3} \delta\rho + \frac{3\bar{\rho}c^2}{a^3} \Phi$$

$$\delta T_\alpha^0 = -\frac{c^2}{a^3} \sum_n m_n \delta(\mathbf{r} - \mathbf{r}_n) \tilde{v}_n^\alpha + \frac{\bar{\rho}c^2}{a^3} B_\alpha = -\frac{c^2}{a^3} \sum_n \rho_n \tilde{v}_n^\alpha + \frac{\bar{\rho}c^2}{a^3} B_\alpha$$

$$\delta T_\alpha^\beta = 0$$

replacements:

$$\rho\Phi \rightarrow \bar{\rho}\Phi, \quad \rho\mathbf{B} \rightarrow \bar{\rho}\mathbf{B}$$

↓ 1<sup>st</sup> order ↓

★ 
$$\Delta\Phi - 3\tilde{H}(\Phi' + \tilde{H}\Phi) - \frac{3\kappa\bar{\rho}c^2}{2a}\Phi = \frac{\kappa c^2}{2a}\delta\rho$$

★ 
$$\frac{1}{4}\Delta\mathbf{B} + \nabla(\Phi' + \tilde{H}\Phi) - \frac{\kappa\bar{\rho}c^2}{2a}\mathbf{B} = -\frac{\kappa c^2}{2a} \sum_n m_n \delta(\mathbf{r} - \mathbf{r}_n) \tilde{\mathbf{v}}_n = -\frac{\kappa c^2}{2a} \sum_n \rho_n \tilde{\mathbf{v}}_n$$

**Continuity Eq.:**  $\rho'_n + \nabla(\rho_n \tilde{\mathbf{v}}_n) = 0$

$$\tilde{\mathbf{v}}_n(\eta) \equiv d\mathbf{r}_n/d\eta \equiv (\tilde{v}_n^1, \tilde{v}_n^2, \tilde{v}_n^3)$$

$$\sum_n \rho_n \tilde{\mathbf{v}}_n = \underbrace{\nabla \Xi}_{\text{grad}} + \underbrace{\left( \sum_n \rho_n \tilde{\mathbf{v}}_n - \nabla \Xi \right)}_{\text{curl}}$$

$$\Xi = \frac{1}{4\pi} \sum_n m_n \frac{(\mathbf{r} - \mathbf{r}_n) \tilde{\mathbf{v}}_n}{|\mathbf{r} - \mathbf{r}_n|^3}$$

$$\Phi' + \tilde{H}\Phi = -\frac{\kappa c^2}{2a} \Xi$$

## Fourier transform:

$$\hat{\Xi}(\eta, \mathbf{k}) \equiv \int \Xi(\eta, \mathbf{r}) \exp(-i\mathbf{k}\mathbf{r}) d\mathbf{r} = -\frac{i}{k^2} \sum_n m_n (\mathbf{k}\tilde{\mathbf{v}}_n) \exp(-i\mathbf{k}\mathbf{r}_n) \quad k \equiv |\mathbf{k}|$$

$$\hat{\rho}_n(\eta, \mathbf{k}) \equiv \int \rho_n(\eta, \mathbf{r}) \exp(-i\mathbf{k}\mathbf{r}) d\mathbf{r} = m_n \int \delta(\mathbf{r} - \mathbf{r}_n) \exp(-i\mathbf{k}\mathbf{r}) d\mathbf{r} = m_n \exp(-i\mathbf{k}\mathbf{r}_n)$$

$$\frac{1}{4}\Delta\mathbf{B} - \frac{\kappa\bar{\rho}c^2}{2a}\mathbf{B} = -\frac{\kappa c^2}{2a}\left(\sum_n \rho_n \tilde{\mathbf{v}}_n - \nabla\Xi\right)$$

$$-\frac{k^2}{4}\hat{\mathbf{B}} - \frac{\kappa\bar{\rho}c^2}{2a}\hat{\mathbf{B}} = -\frac{\kappa c^2}{2a}\left(\sum_n \hat{\rho}_n \tilde{\mathbf{v}}_n - i\mathbf{k}\hat{\Xi}\right)$$

$$\hat{\mathbf{B}} = \frac{2\kappa c^2}{a}\left(k^2 + \frac{2\kappa\bar{\rho}c^2}{a}\right)^{-1} \sum_n m_n \exp(-i\mathbf{k}\mathbf{r}_n) \left(\tilde{\mathbf{v}}_n - \frac{(\mathbf{k}\tilde{\mathbf{v}}_n)}{k^2}\mathbf{k}\right)$$

$$\mathbf{B} = \frac{\kappa c^2}{8\pi a} \sum_n \left[ \frac{m_n \tilde{\mathbf{v}}_n}{|\mathbf{r} - \mathbf{r}_n|} \cdot \frac{(3 + 2\sqrt{3}q_n + 4q_n^2) \exp(-2q_n/\sqrt{3}) - 3}{q_n^2} + \frac{m_n [\tilde{\mathbf{v}}_n (\mathbf{r} - \mathbf{r}_n)]}{|\mathbf{r} - \mathbf{r}_n|^3} (\mathbf{r} - \mathbf{r}_n) \cdot \frac{9 - (9 + 6\sqrt{3}q_n + 4q_n^2) \exp(-2q_n/\sqrt{3})}{q_n^2} \right]$$

$$\Delta\Phi - \frac{3\kappa\bar{\rho}c^2}{2a}\Phi = \frac{\kappa c^2}{2a}\delta\rho - \frac{3\kappa c^2\tilde{H}}{2a}\Xi$$

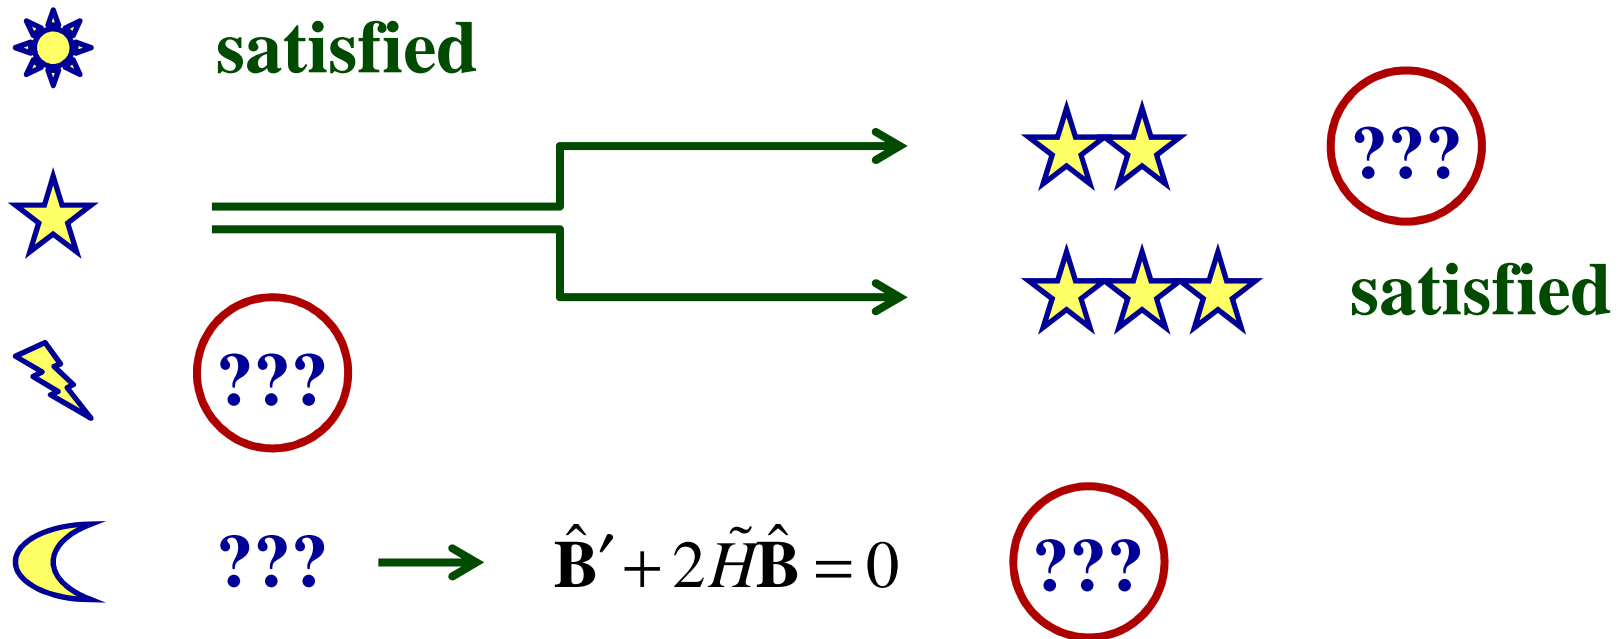

$$-k^2\hat{\Phi} - \frac{3\kappa\bar{\rho}c^2}{2a}\hat{\Phi} = \frac{\kappa c^2}{2a}\sum_n \hat{\rho}_n - \frac{\kappa\bar{\rho}c^2}{2a}(2\pi)^3\delta(\mathbf{k}) - \frac{3\kappa c^2\tilde{H}}{2a}\hat{\Xi}$$

$$\hat{\Phi} = -\frac{\kappa c^2}{2a}\left(k^2 + \frac{3\kappa\bar{\rho}c^2}{2a}\right)^{-1}\left[\sum_n m_n \exp(-i\mathbf{k}\mathbf{r}_n)\left(1 + 3i\tilde{H}\frac{(\mathbf{k}\tilde{\mathbf{v}}_n)}{k^2}\right) - \bar{\rho}(2\pi)^3\delta(\mathbf{k})\right]$$

$$\Phi = \frac{1}{3} - \frac{\kappa c^2}{8\pi a}\sum_n \frac{m_n}{|\mathbf{r} - \mathbf{r}_n|} \exp(-q_n) + \frac{3\kappa c^2}{8\pi a}\tilde{H}\sum_n \frac{m_n \left[\tilde{\mathbf{v}}_n(\mathbf{r} - \mathbf{r}_n)\right]}{|\mathbf{r} - \mathbf{r}_n|} \cdot \frac{1 - (1 + q_n)\exp(-q_n)}{q_n^2}$$

$$\mathbf{q}_n(\eta, \mathbf{r}) \equiv \sqrt{\frac{3\kappa\bar{\rho}c^2}{2a}}(\mathbf{r} - \mathbf{r}_n) \quad q_n \equiv |\mathbf{q}_n|$$

Thus, explicit expressions for 1<sup>st</sup> order vector and scalar cosmological perturbations are determined.

**Incidentally,**  $\nabla\mathbf{B} = 0 \rightarrow \mathbf{k}\hat{\mathbf{B}} = 0$  **satisfied**

# Equations of motion

## Spacetime interval for the $n$ -th particle

$$ds_n = a \left[ 1 + 2\Phi + 2B_\alpha \tilde{v}_n^\alpha - (1 - 2\Phi) \delta_{\alpha\beta} \tilde{v}_n^\alpha \tilde{v}_n^\beta \right]^{1/2} d\eta$$

$$\left[ a \left( \mathbf{B}|_{\mathbf{r}=\mathbf{r}_n} - \tilde{\mathbf{v}}_n \right) \right]' = a \nabla \Phi|_{\mathbf{r}=\mathbf{r}_n} \quad \left| \rho_n \right| \quad \left| \sum_n \right.$$

$$\begin{aligned} \rho(a\mathbf{B})' - \sum_n \rho_n (a\tilde{\mathbf{v}}_n)' &= a\rho\nabla\Phi & \sum_n \rho_n (a\tilde{\mathbf{v}}_n)' &= -a\bar{\rho}\nabla\Phi + \bar{\rho}(a\mathbf{B})' \\ \sum_n \hat{\rho}_n (a\tilde{\mathbf{v}}_n)' &= \sum_n m_n \exp(-i\mathbf{k}\mathbf{r}_n) (a\tilde{\mathbf{v}}_n)' & &= -a\bar{\rho} \cdot i\mathbf{k}\hat{\Phi} + \bar{\rho}(a\hat{\mathbf{B}})' \end{aligned}$$

all ??? satisfied

$$(a\tilde{\mathbf{v}}_n)' = -a \left( \nabla \Phi|_{\mathbf{r}=\mathbf{r}_n} + \tilde{H} \mathbf{B}|_{\mathbf{r}=\mathbf{r}_n} \right)$$

# Menu of properties, benefits, and bonuses

---

## Minkowski background limit

$$a \rightarrow \text{const} \quad \Rightarrow \quad \tilde{H} \rightarrow 0 \quad \bar{\rho} \rightarrow 0 \quad \Rightarrow \quad q_n \rightarrow 0$$

$$\Phi \rightarrow -\frac{\kappa c^2}{8\pi a} \sum_n \frac{m_n}{|\mathbf{r} - \mathbf{r}_n|} = -\frac{G_N}{c^2} \sum_n \frac{m_n}{|\mathbf{R} - \mathbf{R}_n|}$$

$$\begin{aligned} \mathbf{R} &= a\mathbf{r} \\ \mathbf{R}_n &= a\mathbf{r}_n \end{aligned}$$

The constant **1/3** has been dropped since it originates exclusively from the terms containing  $\bar{\rho}$ .

**physical  
radius-  
vectors**

$$\mathbf{B} \rightarrow \frac{\kappa c^2}{4\pi a} \sum_n \left[ \frac{m_n \tilde{\mathbf{v}}_n}{|\mathbf{r} - \mathbf{r}_n|} + \frac{m_n [\tilde{\mathbf{v}}_n (\mathbf{r} - \mathbf{r}_n)]}{|\mathbf{r} - \mathbf{r}_n|^3} (\mathbf{r} - \mathbf{r}_n) \right]$$

$$= \frac{G_N}{2c^2} \sum_n \frac{m_n}{|\mathbf{R} - \mathbf{R}_n|} \left[ 4\tilde{\mathbf{v}}_n + \frac{4[\tilde{\mathbf{v}}_n (\mathbf{R} - \mathbf{R}_n)]}{|\mathbf{R} - \mathbf{R}_n|} \frac{\mathbf{R} - \mathbf{R}_n}{|\mathbf{R} - \mathbf{R}_n|} \right]$$

$$\tilde{\mathbf{v}}_n \equiv \frac{d\mathbf{r}_n}{d\eta}, \quad \mathbf{v}_n \equiv \frac{d\mathbf{r}_n}{dt}$$

$$cdt = ad\eta \quad \Rightarrow \quad \tilde{\mathbf{v}}_n = \frac{a\mathbf{v}_n}{c}$$

**synchronous time**

**The sum of these integers**

$$4 + 4 = 8$$

**is the same for the other appropriate choices of gauge conditions as well.**

**complete agreement with textbooks**

# Newtonian approximation

## Homogeneity scale

$$\tilde{\mathbf{v}}_n \rightarrow 0 \quad (\text{peculiar motion as a gravitational field source is completely ignored})$$
$$q_n \ll 1$$

$$\Phi \rightarrow -\frac{G_N}{c^2} \sum_n \frac{m_n}{|\mathbf{R} - \mathbf{R}_n|} \quad \mathbf{B} \rightarrow 0$$

The constant **1/3** has been dropped for the other reason: only the gravitational potential gradient enters into Eqs. of motion describing dynamics of the considered system of gravitating masses.

$$\ddot{\mathbf{R}}_j - \frac{\ddot{a}}{a} \mathbf{R}_j = -G_N \sum_{n \neq j} \frac{m_n (\mathbf{R}_j - \mathbf{R}_n)}{|\mathbf{R}_j - \mathbf{R}_n|^3}$$

**dot: derivative  
with respect to  $t$**

**complete agreement with Eqs. for N-body simulations**

**What are the applicability  
bounds for the inequality?**

$$q_n \ll 1 \quad \Leftrightarrow \quad |\mathbf{R} - \mathbf{R}_n| \ll \lambda$$

$$H \equiv \frac{\dot{a}}{a} = \frac{c\tilde{H}}{a}$$

**Hubble  
parameter**

$$\lambda \equiv \sqrt{\frac{2a^3}{3\kappa\bar{\rho}c^2}} = \sqrt{\frac{2c^2}{9H_0^2\Omega_M} \left(\frac{a}{a_0}\right)^3}$$

$$H_0 \approx 68 \text{ km/s/Mpc}$$

$$\Omega_M \approx 0.31$$

$$\Omega_M \equiv \frac{\kappa\bar{\rho}c^4}{3H_0^2a_0^3}$$

**current  
values**

today

$$\lambda_0 \approx 3700 \text{ Mpc} = 3.7 \text{ Gpc} \approx 12 \text{ Gly}$$

**This Yukawa interaction range and dimensions of the known largest cosmic structures are of the same order !**

**Hercules-Corona Borealis Great Wall ~ 2-3 Gpc**

**Huge Large Quasar Group ~ 1.2 Gpc**

R.G. Clowes, K.A. Harris, S. Raghunathan, L.E. Campusano, I.K. Soechting, M.J. Graham, Mon. Not. R. Astron. Soc. 429, 2910 (2013); [arXiv:1211.6256](#)

**Formidable challenge: dimensions of the largest cosmic structures essentially exceed the scale of homogeneity  $\sim 370$  Mpc.**

J.K. Yadav, J.S. Bagla and N. Khandai, Mon. Not. Roy. Astron. Soc. 405, 2009 (2010); [arXiv:1001.0617v2](#)

**obvious hint at a resolution opportunity: to associate the scale of homogeneity with  $\lambda$  ( $\sim 3.7$  Gpc today) instead of  $\sim 370$  Mpc**

$$\underline{\lambda \sim a^{3/2}}$$

**Cosmological principle** (Universe is homogeneous and isotropic when viewed at a sufficiently large scale) is saved and reinstated when this typical averaging scale is **greater than  $\lambda$** .

$$\underline{a \downarrow \Rightarrow \lambda \downarrow}$$

## What are the applicability bounds for peculiar motion ignoring?

$$\left| \frac{\frac{3\kappa c^2}{8\pi a} \tilde{H} \cdot \frac{m_n \left[ \tilde{\mathbf{v}}_n (\mathbf{r} - \mathbf{r}_n) \right]}{|\mathbf{r} - \mathbf{r}_n|} \cdot \frac{1}{2}}{-\frac{\kappa c^2}{8\pi a} \cdot \frac{m_n}{|\mathbf{r} - \mathbf{r}_n|}} \right| \sim ???$$

**ratio of velocity  
-dependent and  
-independent  
terms in  $\Phi$**

**For a single gravitating mass  $m_1$  momentarily located at the origin of coordinates with the velocity collinear to  $\mathbf{r}$ :**

$$\frac{\frac{3\kappa c^2}{8\pi a} \tilde{H} \cdot m_1 \tilde{v}_1 \cdot \frac{1}{2}}{\frac{\kappa c^2}{8\pi a} \cdot \frac{m_1}{r}} = \frac{3}{2} \tilde{H} \tilde{v}_1 r = \frac{3}{2} \frac{H a v_1 R}{c^2}$$

$v_1 \equiv |\mathbf{v}_1| = c \tilde{v}_1 / a$   
 $R \equiv |\mathbf{R}| = ar$   
 $q_1 \ll 1$

$$3H \cdot \underbrace{av_1 \cdot R / (2c^2)} \ll (1 \div 2) \times 10^{-3}$$

same estimate for a ratio of derivatives

absolute value of the particle's physical peculiar velocity  $\sim (250 \div 500) \text{ km/s}$

$$\lambda \neq \underbrace{c/H} \quad \text{if} \quad q \equiv -\ddot{a} / (aH^2) \neq -2/3$$

Hubble radius

$$a/a_0 \neq 1.16 \quad \text{(future)}$$

deceleration parameter

$$\frac{1}{\lambda^2} = \frac{3H^2}{c^2} (1+q) = -\frac{3\dot{H}}{c^2}$$

$$\lambda = \frac{1}{\sqrt{3(1+q)}} \frac{c}{H}$$

# Yukawa interaction

## Zero average values

$$\Phi = \frac{1}{3} + \left( \sum_n \phi_n \right) + \text{velocity-dependent part}$$

manifestation of the superposition principle

$$\phi_n = -\frac{\kappa c^2}{8\pi a} \frac{m_n}{|\mathbf{r} - \mathbf{r}_n|} \exp(-q_n) = -\frac{G_N m_n}{c^2 |\mathbf{R} - \mathbf{R}_n|} \exp\left(-\frac{|\mathbf{R} - \mathbf{R}_n|}{\lambda}\right)$$

**Yukawa potentials coming from each single particle, with the same interaction radius  $\lambda$**

# Computation of a sum in Newtonian approximation

P.J.E. Peebles, *The large-scale structure of the Universe*,  
Princeton University Press, Princeton (1980).

$$\Phi \sim \int d\mathbf{r}' \frac{\rho|_{\mathbf{r}=\mathbf{r}'} - \bar{\rho}}{|\mathbf{r} - \mathbf{r}'|} \quad (8.1)$$

$$-\nabla\Phi \sim \int d\mathbf{r}' \frac{\rho|_{\mathbf{r}=\mathbf{r}'}}{|\mathbf{r} - \mathbf{r}'|^3} (\mathbf{r} - \mathbf{r}') \quad (8.3)$$

$$-\nabla\Phi \sim \underbrace{\sum_n \frac{m_n}{|\mathbf{r} - \mathbf{r}_n|^3} (\mathbf{r} - \mathbf{r}_n)} \quad (8.5)$$

**not well-defined, depends on the order of adding terms;**  
**addition in the order of increasing distances  $|\mathbf{r} - \mathbf{r}_n|$  and**  
**a spatially homogeneous and isotropic random process**  
**with the correlation length  $\ll c/H$  for the distribution**  
**of particles are required for convergence of such a sum**

## Summing up the Yukawa potentials

**convergent** in all points  
except the positions of  
the gravitating masses

no famous **Neumann-  
Seeliger** gravitational  
paradox

$$\sum_n \phi_n$$

no obstacles in the  
way of computation,  
the order of adding  
terms corresponding  
to different particles  
is **arbitrary** and does  
not depend on their  
locations

particles' distribution may be **nonrandom**  
and **anisotropic** (e.g., the lattice Universe)

$$\bar{\phi}_n \equiv \frac{1}{V} \int_V d\mathbf{r} \phi_n = -\frac{\kappa c^2}{8\pi a} \frac{m_n}{V} \int_V \frac{d\mathbf{r}}{|\mathbf{r} - \mathbf{r}_n|} \exp\left(-\frac{a|\mathbf{r} - \mathbf{r}_n|}{\lambda}\right) = -\frac{\kappa c^2}{8\pi a} \frac{m_n}{V} \frac{4\pi\lambda^2}{a^2} = -\frac{m_n}{V} \frac{1}{3\bar{\rho}}$$

**comoving averaging volume, tending to infinity**

$$\frac{1}{V} \sum_n m_n \equiv \bar{\rho} \qquad \sum_n \bar{\phi}_n = -\frac{1}{3\bar{\rho}} \cdot \frac{1}{V} \sum_n m_n = -\frac{1}{3}$$

$$\bar{\Phi} = \frac{1}{3} + \underbrace{\sum_n \bar{\phi}_n}_{-1/3} + \overbrace{\text{velocity-dependent part}}_0 = 0$$

$\bar{\mathbf{B}} = 0$

$$\overline{\delta T_0^0} = 0$$

$$\overline{\delta T_\alpha^0} = 0$$

**no first-order backreaction effects**

In addition, in the limiting case of the homogeneous mass distribution  $\Phi = 0$  at any point. For example, on the surface of a sphere of the physical radius  $R$  the contributions from its **inner** and **outer** regions combined with  $1/3$  give  $0$ .

Then Eq. of motion of a test cosmic body reads:

$$\ddot{\mathbf{R}} = \frac{\ddot{a}}{a} \mathbf{R}$$

( $\ddot{\mathbf{R}}$  is reasonably connected with **the acceleration of the global Universe expansion**)

# Nonzero spatial curvature

## Screening of gravity

$$\Delta\Phi + \left( 3K - \frac{3\kappa\bar{\rho}c^2}{2a} \right) \Phi = \frac{\kappa c^2}{2a} \delta\rho$$

**velocities'  
contributions  
dropped**

**+ 1 for the spherical (closed) space**  
**– 1 for the hyperbolic (open) space**

Solutions are **smooth** at any point except particles' positions (where **Newtonian limits** are reached) and characterized by **zero average values** as before.

$\lambda = \frac{1}{\sqrt{3(1+q)}} \frac{c}{H}$  **not only for the curved space,  
but also in the presence of  
an arbitrary number  
of additional Universe components  
in the form of barotropic perfect fluids**

**at the radiation-dominated stage  
of the Universe evolution**  $\lambda \sim a^2$

**Since  $\lambda$  may be associated with the homogeneity  
scale, asymptotic behaviour  $\lambda \rightarrow 0$  when  $a \rightarrow 0$   
supports the idea of the homogeneous Big Bang.**

irresistible temptation of associating the Yukawa interaction range  $\lambda$  with the graviton Compton wavelength  $h/(m_g c)$

↓ ↓  
**Planck constant**    **graviton mass**

$$\hbar \equiv h/(2\pi)$$

$$\lambda = \hbar/(m_g c)$$

**(today)**

$$\frac{1}{\lambda^2} = \frac{m_g^2 c^2}{\hbar^2} = \frac{2\Lambda}{3}$$

$$m_g = \hbar/(\lambda c) \approx 1.7 \times 10^{-33} \text{ eV}$$

$$9\Omega_M = 4\Omega_\Lambda$$

$$\Omega_\Lambda \equiv \frac{\Lambda c^2}{3H_0^2}$$

$$\Omega_M + \Omega_\Lambda = 1$$

$$\Omega_M = 4/13 \approx 0.31, \quad \Omega_\Lambda = 9/13 \approx 0.69$$

# Conclusion

---

I

**first-order scalar and vector cosmological perturbations, produced by inhomogeneities in the discrete form of a system of separate point-like gravitating masses, are derived without any extra approximations in addition to the weak gravitational field limit (no  $c^{-1}$  series expansion, no “dictionaries”);**

## II

**obtained metric corrections are valid at all (sub-horizon and super-horizon) scales and converge in all points except locations of sources (where Newtonian limits are reached), and their average values are zero (no first-order backreaction effects);**

## III

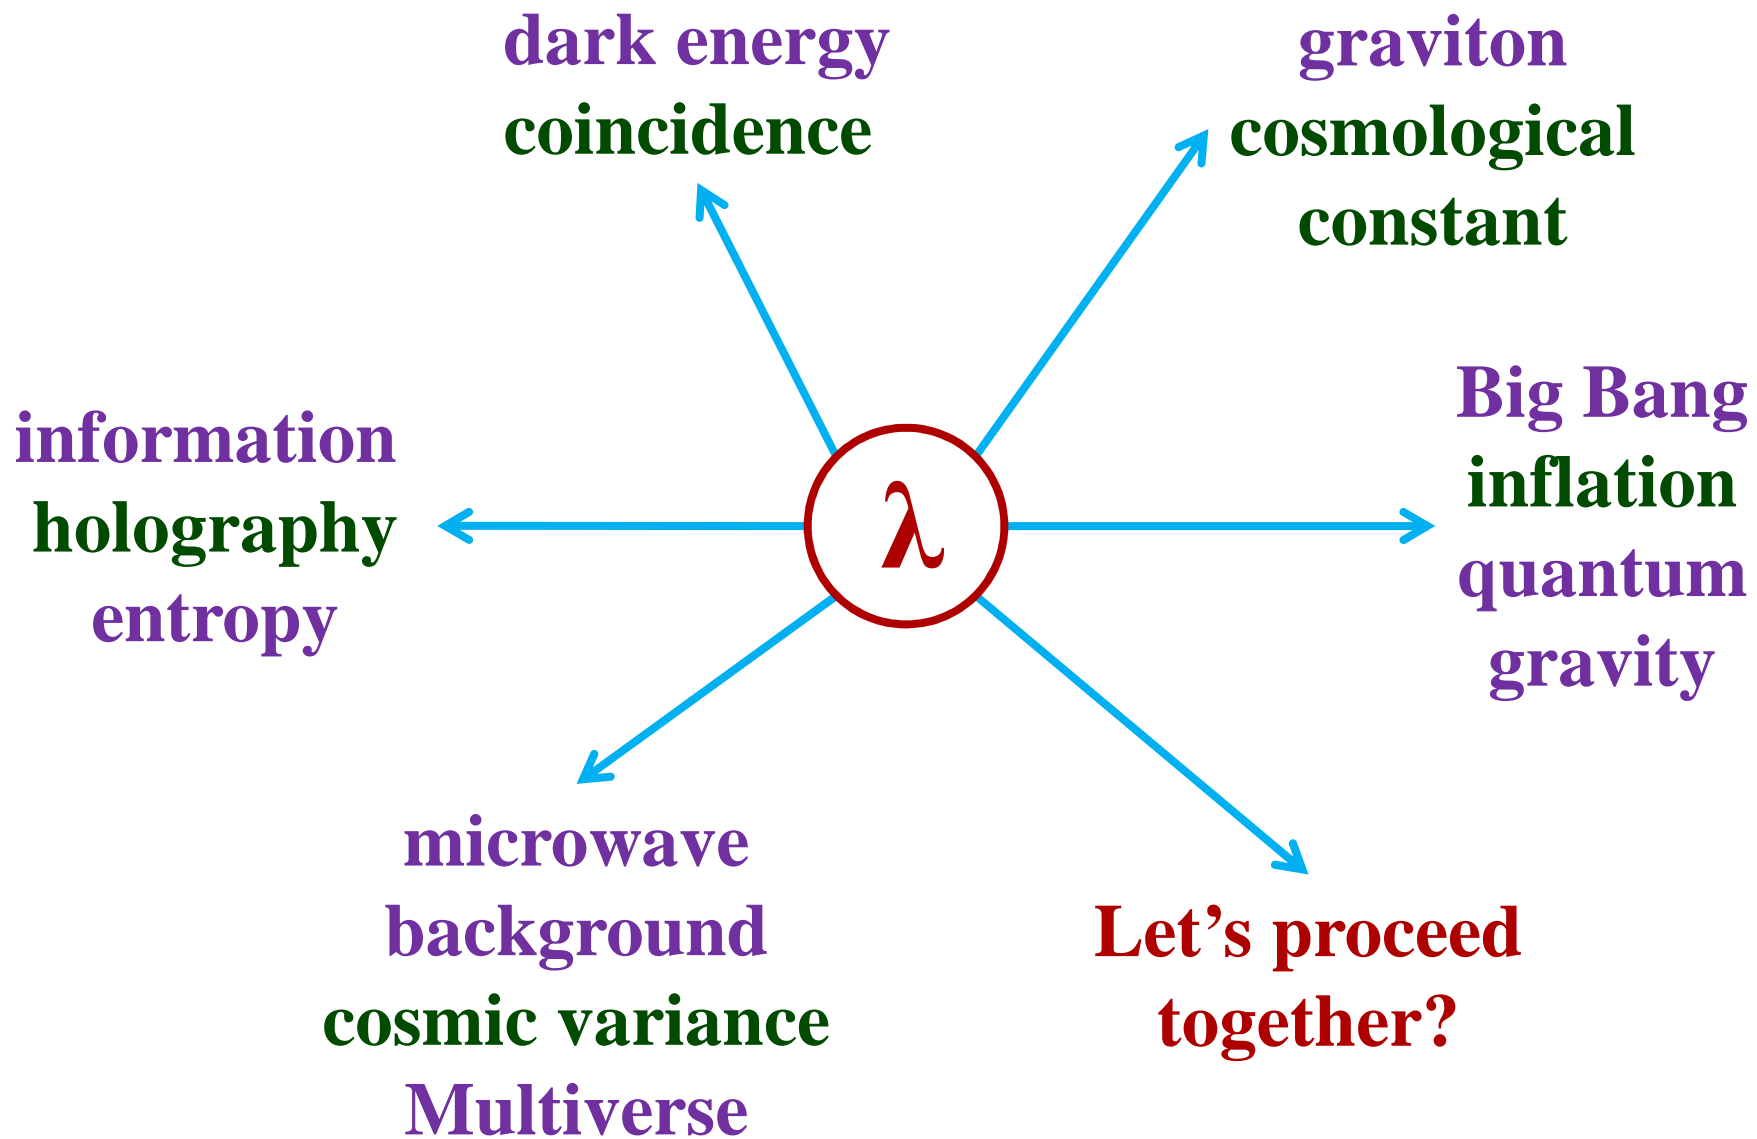

**the Minkowski background limit and Newtonian cosmological approximation are particular cases;**

## IV

**the velocity-independent part of the scalar perturbation contains a sum of Yukawa potentials with the same finite time-dependent Yukawa interaction range, which may be connected with the scale of homogeneity, thereby explaining existence of the largest cosmic structures;**

## V

**the general Yukawa range definition is given for various extensions of the concordance model (nonzero spatial curvature, additional perfect fluids).**

**FUN**

**What is the max.  
depth of Lake  
Geneva?**

**A. 310 m**

**B. 21 cm**

**C. 0.7 AU**

**D. 3.7 Gpc**
