## A bright gamma-ray flare from the blazar B2 1215+30 detected by VERITAS and Fermi-LAT

*Tuesday 15 December 2015 15:03 (21 minutes)*

We report on evidence of simultaneous gamma-ray flaring from the BL Lac source B2 1215+30, detected by VERITAS ( $E > 100$  GeV) and the Fermi Large Area Telescope ( $100 \text{ MeV} < E < 100$  GeV). The source was observed by VERITAS during an exceptional flaring state in 2014 February 08. Investigations of flux variability in the energy range covered by Fermi-LAT, show that the GeV flare occurred contemporaneously with the TeV flare. From the variability time scale we constrain the size of the emission region and derive a limit on the Doppler factor of the relativistic jet of B2 1215+30.
