

# Synthesis Thermoelectric Material $Mg_2Si$ by Quartz Tube Vacuum Furnace from Starting Mg Powder and $SiO_2$ Rice Husk

*Thursday, May 21, 2015 1:00 PM (3h 30m)*

Magnesium silicide ( $Mg_2Si$ ) is a promising for thermoelectric materials due to display a high performance for thermoelectric power generation with ZT about 0.9 at operation temperature 600 to 800 K. This work,  $Mg_2Si$  compound was prepared from starting powder of  $SiO_2$ , which was attracted from rice husk, and Mg powder. The sintering process was performed in quartz tube vacuum at temperature 650 °C with argon atmosphere. Then MgO composition was demolished by chemical process. XRD patterns showed the pure phased of  $Mg_2Si$ . Thermoelectric characterization and properties will be reported.
