Extraction of the distribution function $h_{1T}^{\perp}$ from experimental data

We attempt an extraction of the pretzelosity distribution ($h_{1T}^{\perp}$) from preliminary COMPASS, HERMES, and JLAB experimental data on
$\sin(3\phi_h - \phi_S)$ asymmetry on proton, and effective deuteron and neutron targets.
The resulting distributions, albeit with big errors, for the first time
show tendency for up-quark pretzelosity to be positive and down-quark pretzelosity to be negative.
A model relation of
pretzelosity distribution and orbital angular momentum of quarks is used to estimate contributions of
up and down quarks.
