

Bose-Einstein correlations in various collision systems and energies measured with the CMS experiment

Sandra S. Padula

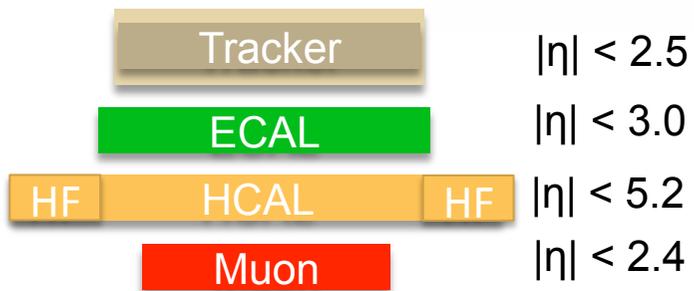

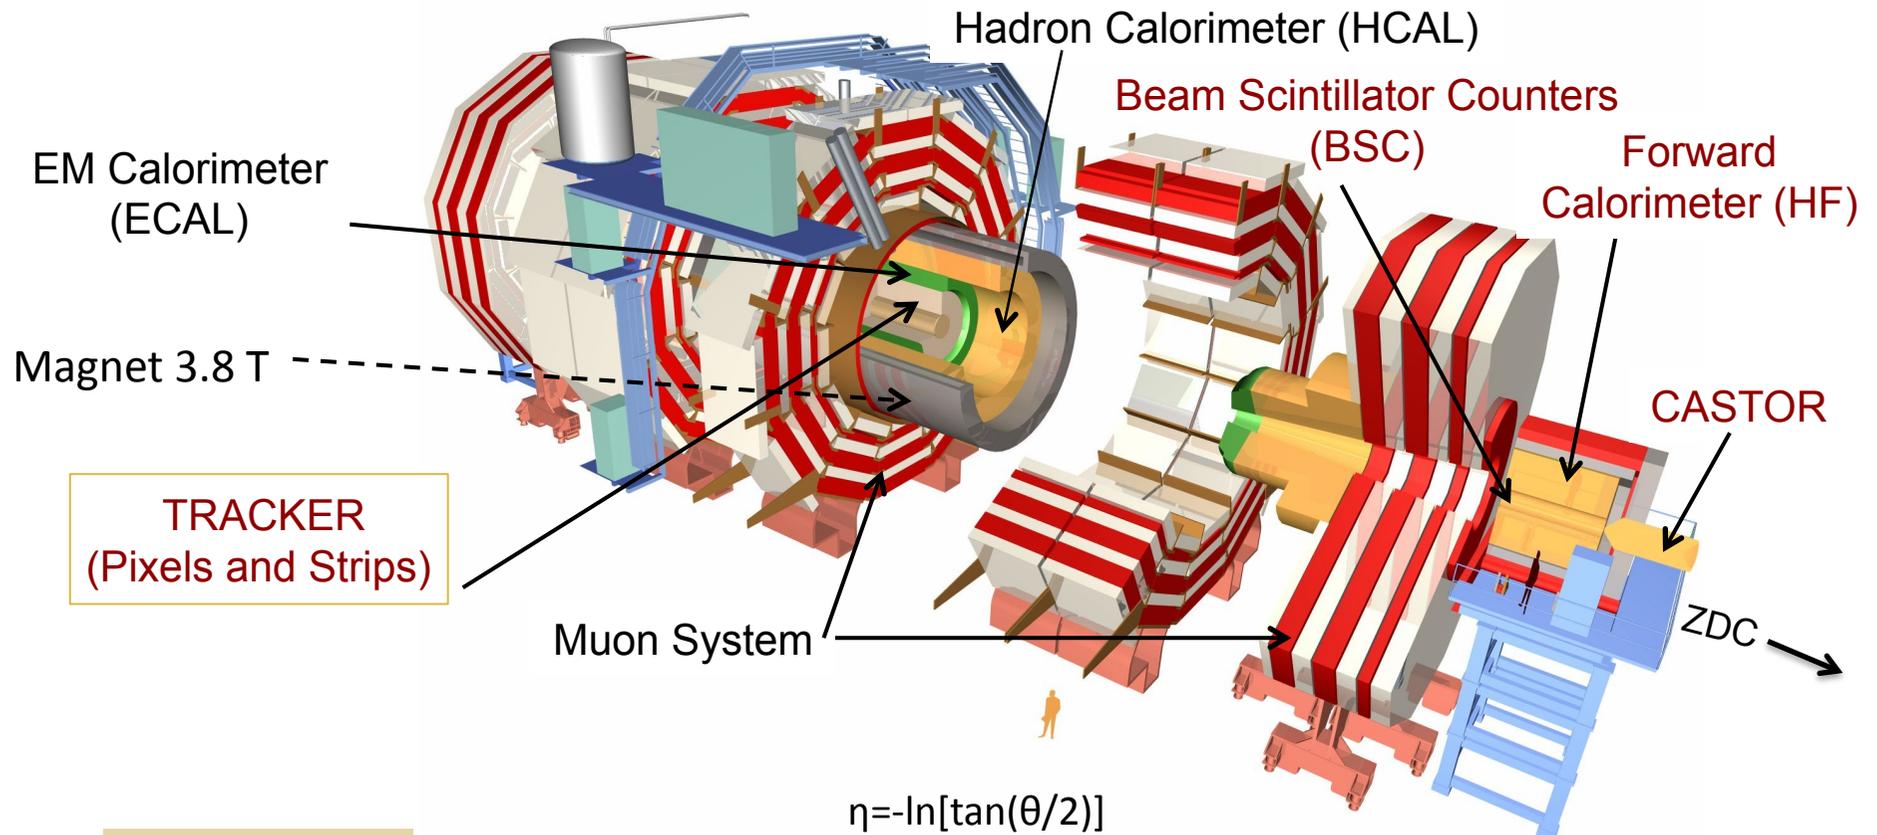

IFT – UNESP

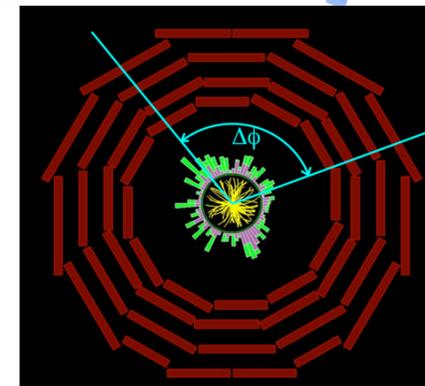

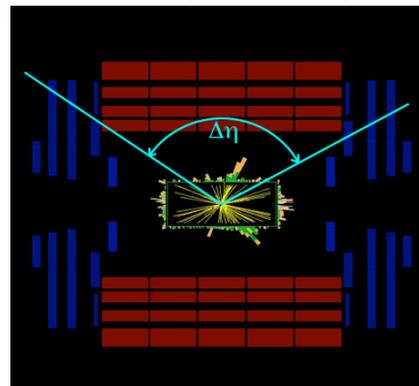

For the CMS Collaboration

DIS2015, Dallas, TX, USA, 04/27-05/01

CMS Detector

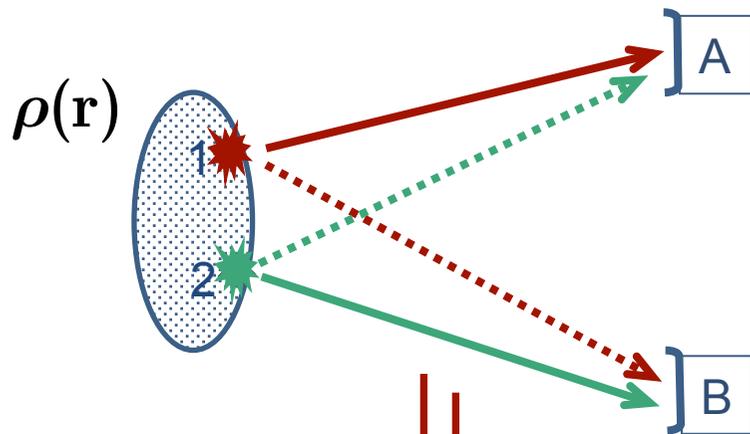

$$\eta = -\ln[\tan(\theta/2)]$$

$$|\Delta\phi| \leq 2\pi$$

BEC basic concepts

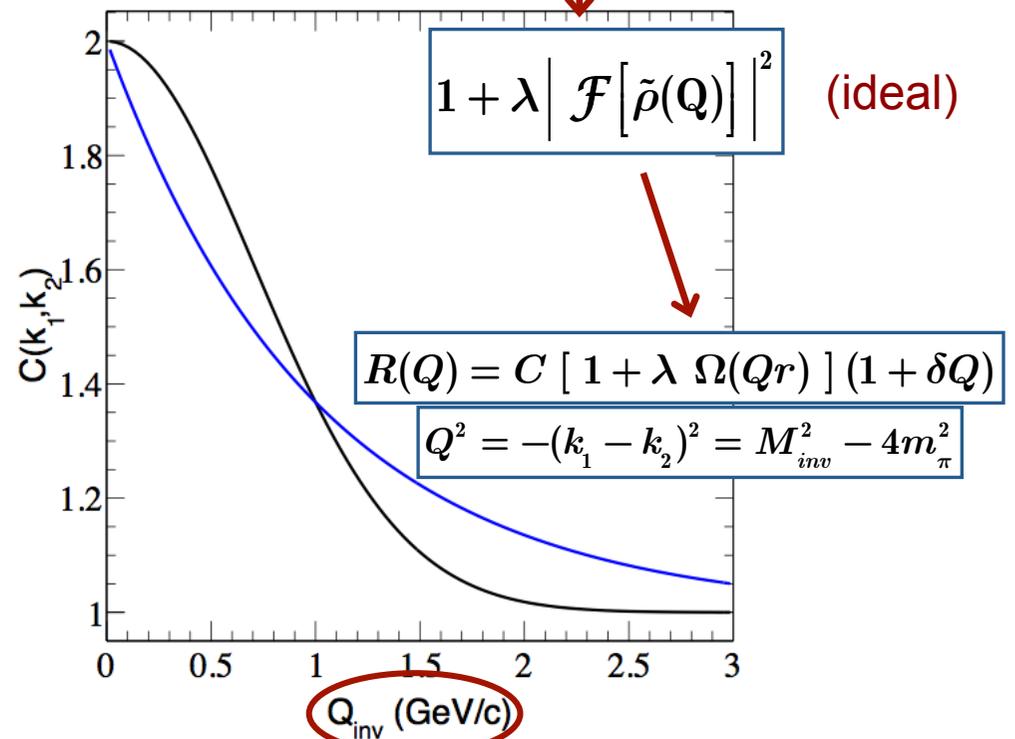

- Detecting two identical bosons emitted from sources 1 & 2 at A & B

- Two-boson correlation function \rightarrow reflects source dimensions

– Correlation Function:

$$R(Q = k_1 - k_2) = \frac{P_2(k_1, k_2)}{P_1(k_1)P_1(k_2)}$$

(two previous CMS papers)

Overview on multi-dimensional BEC

- Part I

- Min Bias pp collisions at $\sqrt{s}=2.76$ TeV and 7 TeV \rightarrow scrutinized by

- extending previous BEC measurements to 2-D and 3-D (also 1-D)

- unidentified charged hadrons \rightarrow technique as in (CMS) PRL 105, 032001 (2010) JHEP05(2011)29

- investigating the behavior of the correlation functions

- three parameterizations of the source and in two reference frames

- dependence on different multiplicity (N_{ch}) and average pair momentum (k_T)

- Part II

- Various systems: Min Bias pp ($\sqrt{s}=0.9, 2.76, 7$ TeV), pPb ($\sqrt{s}=5.02$ TeV) and (peripheral) PbPb ($\sqrt{s}=2.76$ TeV) collisions

- investigate similarities and differences in the three systems

- identified pions and kaons with data-driven technique

- stretched exponential fit in 1-D, 2-D and 3-D

- dependence on different multiplicity (N_{ch}) and average pair momentum (k_T)

Part I: BEC with Double Ratio technique

- Single Ratios (SR)

$$R^{\text{exp}}(Q = k_1 - k_2) = \frac{S(k_1, k_2)}{\mathcal{B}(k_1, k_2)}$$

Pairs of same charge tracks from the same event (with BEC)

Different reference samples (no BEC)

– Background pair selection

- ❑ Same event, ≠ charges (☹ resonances)
- ❑ Rotation of 1 track of the pair
- ❑ Mixed events (😊) → (similar N_{ch} within same η range)

Coulomb Final State Interact.
Gamow factor applied to data

$$\Upsilon(\eta_\omega) = \frac{\eta_\omega/Q}{\exp(\eta_\omega/Q) - 1}$$

$$\eta_\omega = \pm 2\pi\alpha_{\text{em}}m_\pi$$

Double Ratios (DR) → reduce bias:

$$\mathcal{R}(Q) = \frac{R(Q)}{R_{MC}(Q)} = \frac{\left(\frac{dN_{\text{signal}} / dQ}{dN_{\text{ref}} / dQ} \right)}{\left(\frac{dN_{MC, \text{like}} / dQ}{dN_{MC, \text{ref}} / dQ} \right)} \quad \left. \vphantom{\frac{dN_{MC, \text{like}} / dQ}{dN_{MC, \text{ref}} / dQ}} \right\} \text{(No BEC in MC)}$$

CMS Collab., PRL 105, 032001 (2010)
CMS Collab., JHEP05(2011)29

Data and MC samples – Track selection

\sqrt{s}	pp collisions	
	Data Sample	Monte Carlo
2.76 TeV	Minimum bias/2013 (3.4 M)	Pythia 6 Z-2 tune (2 M)
7 TeV	Full Minimum bias sample (23 M+16M+4M)	Pythia 6 Z-2 tune (33 M)

- Track selection cuts

- ❑ Tracks associated with most populated vertex
- ❑ $\chi^2 < 5$
- ❑ $d_{xy} < 0.15$ cm
- ❑ $R_{min} > 20$ cm
- ❑ $p_T > 0.2$ GeV/c
- ❑ $\eta < |2.4|$

First part of the talk:
charged hadrons (h^\pm)
(assumed to be dominated by π 's)

Part II: Data-driven technique (cluster removal)

- Correlation function

$$R^{\text{exp}} \rightarrow C_2(q_{\text{inv}}) = \frac{\mathcal{S}(k_1, k_2)}{\mathcal{B}(k_1, k_2)}$$

- Coulomb (kaons) \rightarrow full correction:

$$\Upsilon(\eta_\omega) \rightarrow K(q_{\text{inv}}) \approx 1 + \pi\eta_\omega \frac{q_{\text{inv}} R}{1.26 + q_{\text{inv}} R}$$

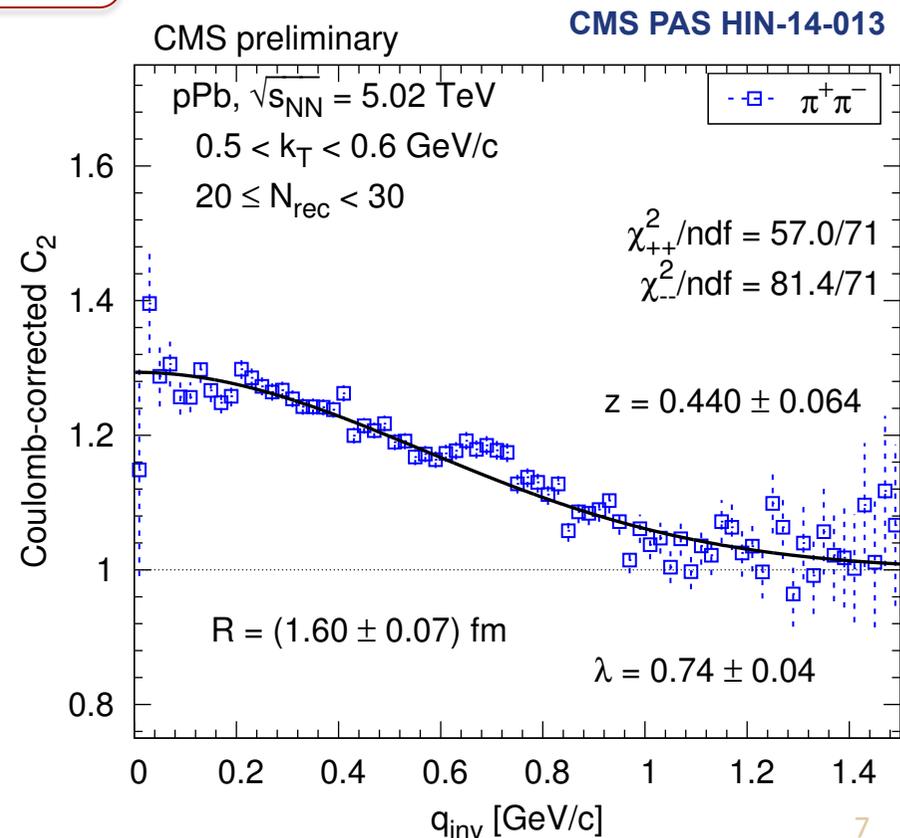

- Cluster contributions

- ❑ Mini-jets
 - ❑ Multi-body resonance decays

- Use (+-) pairs \rightarrow estimate cluster contribution in ($\pm\pm$) pairs

- Systematics

- ❑ Mixed Events
 - ❑ Cluster contributions
 - ❑ Fitting range

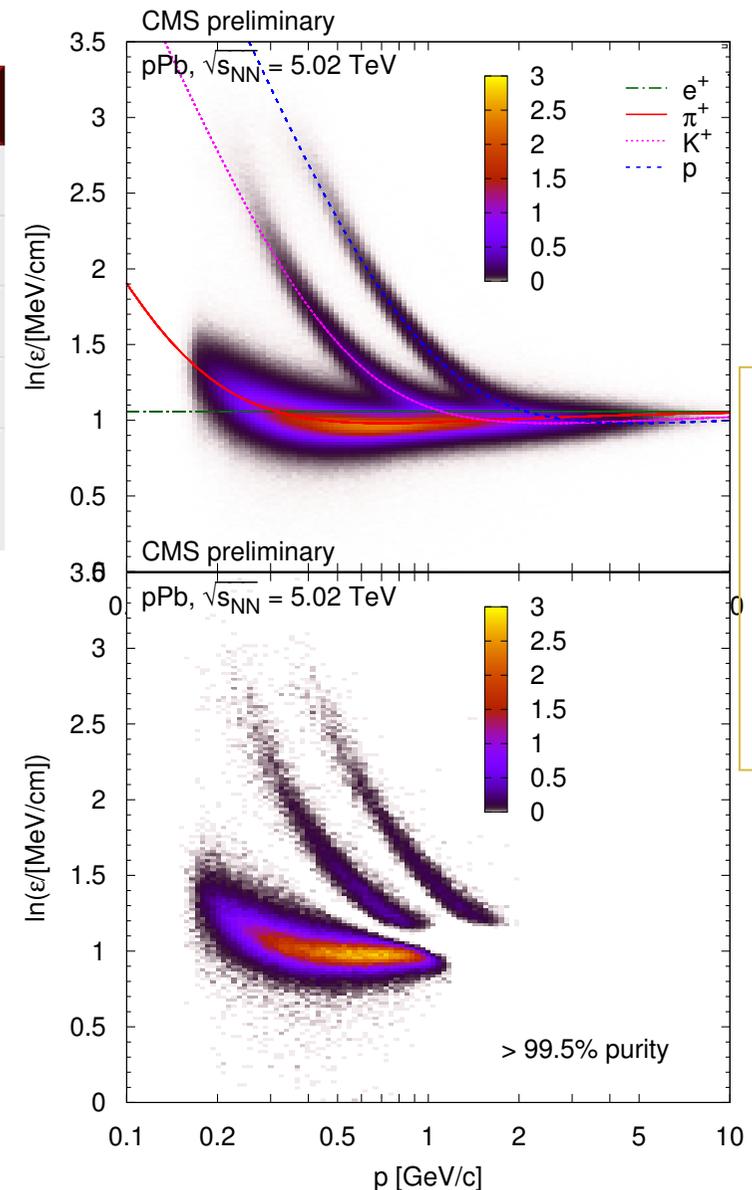

Data Sample and Particle Identification

– Datasets used

$\sqrt{s_{NN}}$	Minimum Bias Events
pp @ 0.9 TeV	8.97 M
pp @ 2.76 TeV	9.62 M
pp @ 7 TeV	6.20 M
pPb @ 5.02 TeV	8.95 M
PbPb @ 2.76 TeV – Peripheral (60-100%)	3.07 M

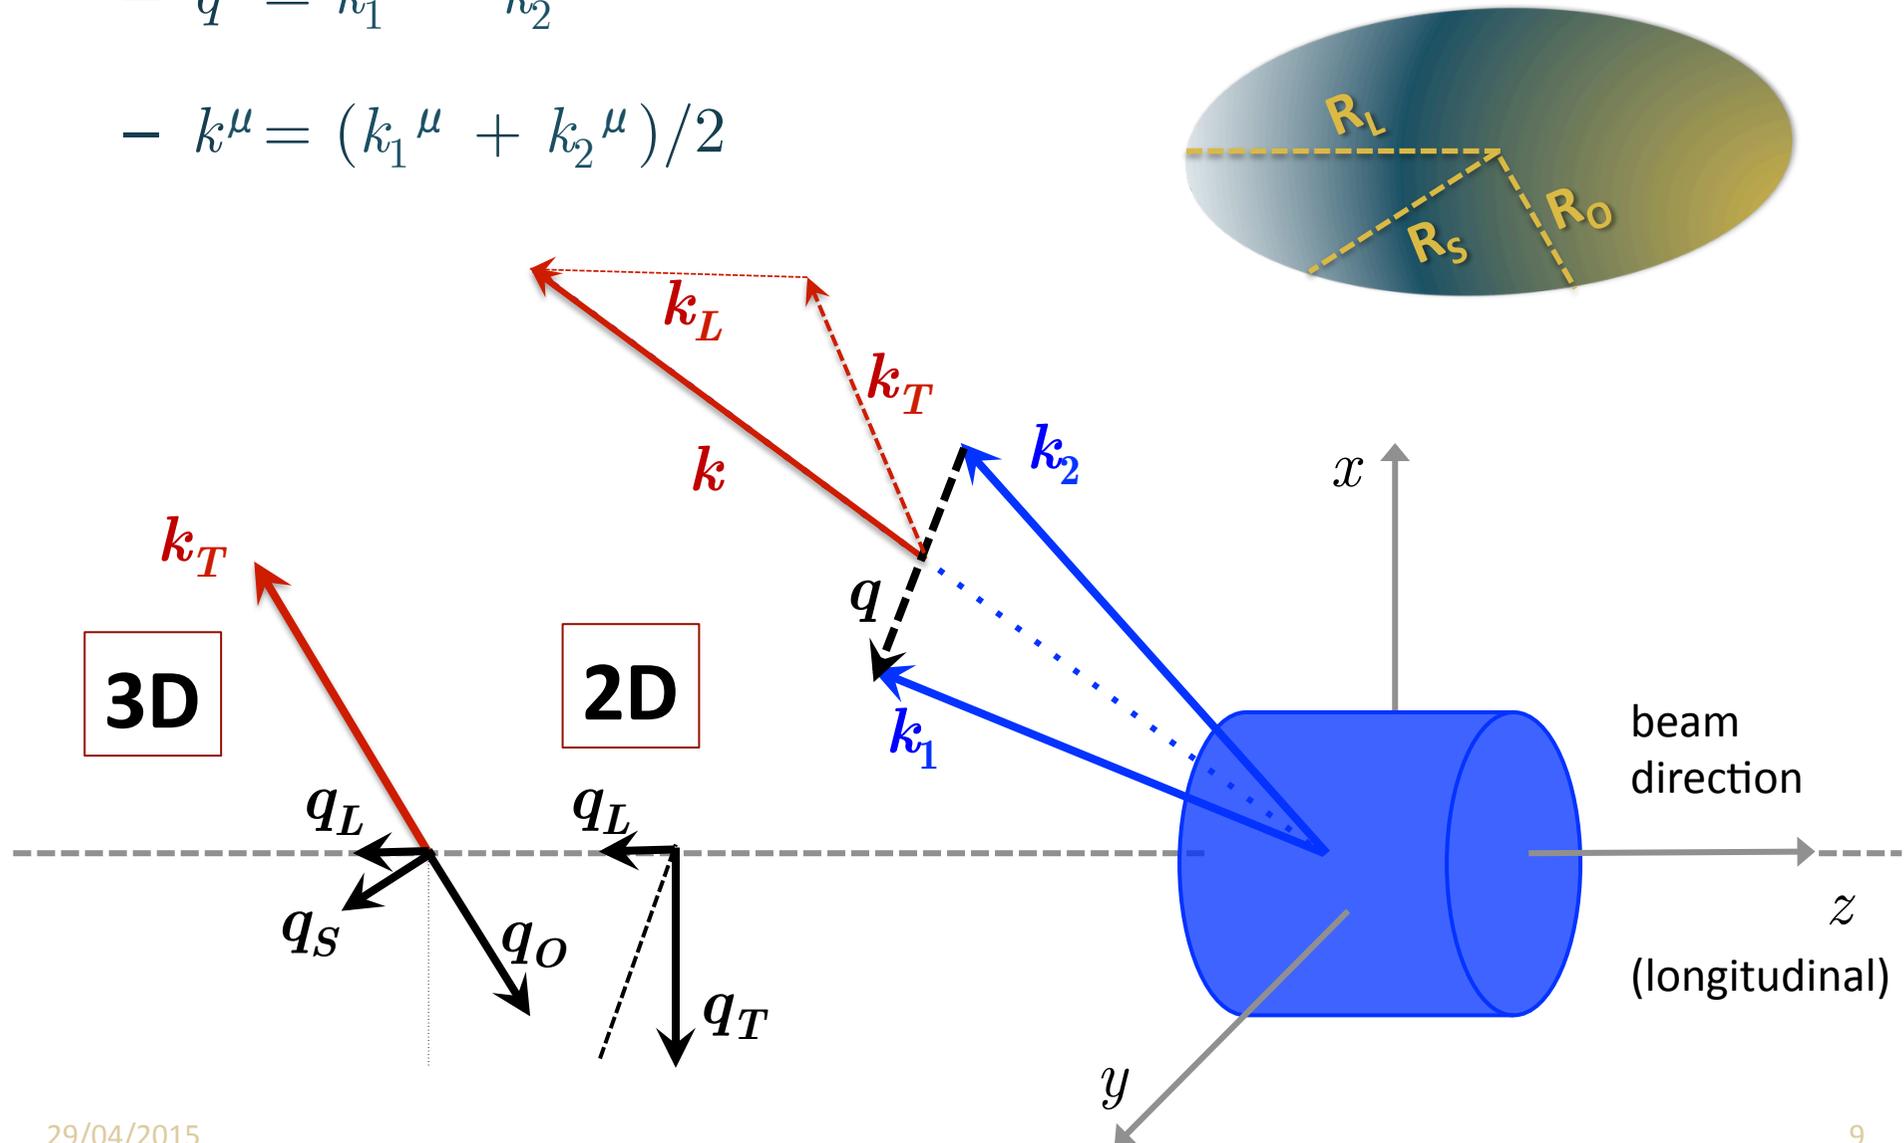

- Tracking : Very low bias tracking (pT > 0.1 GeV/c, at least two tracks)
- PID : Ionization energy loss rate ($\ln \epsilon$)
 - ❑ Momentum range $p < 1.15$ GeV/c (π 's, K's)
 - ❑ $p < 2$ GeV/c (protons)
 - ❑ Determine probability of being a charged π , K, p or e
 - ❑ Used particles with $|\eta| < 1$
- High purity identified particles (> 99.5%)

Decomposition: (q_L, q_T) in 2-D and (q_L, q_O, q_S) in 3-D

$$- q^\mu = k_1^\mu - k_2^\mu$$

$$- k^\mu = (k_1^\mu + k_2^\mu)/2$$

Part I and II – Fit functions summary

- Lévy distribution with index of stability a

□ $a = 1 \rightarrow$ exponential ; $a = 2 \rightarrow$ Gaussian

□ 1D

$$\mathcal{R}(Q_{\text{inv}}) = C[1 + \lambda e^{-(Q_{\text{inv}} R_{\text{inv}})^a}] (1 + \delta Q_{\text{inv}})$$

□ 2-D

$$\mathcal{R}(q_T, q_L) = C \left\{ 1 + \lambda \exp \left[- \left| q_T^2 R_T^2 + q_L^2 R_L^2 + 2q_T q_L R_{LT}^2 \right|^{\frac{a}{2}} \right] \right\} \\ \times (1 + \alpha q_T + \beta q_L)$$

$a = 1$ Stretched Exponentials

T. Csörgö, Hegyi, W. A. Zajc, Eur. Phys. J. **C36** (2004) 67

□ 3 D

$$\mathcal{R}(q_S, q_L, q_O) = C \left\{ 1 + \lambda \exp \left[- \left| q_S^2 R_S^2 + q_L^2 R_L^2 + q_O^2 R_O^2 + 2q_O q_L R_{LO}^2 \right|^{\frac{a}{2}} \right] \right\} \\ (1 + \alpha q_S + \beta q_L + \gamma q_O)$$

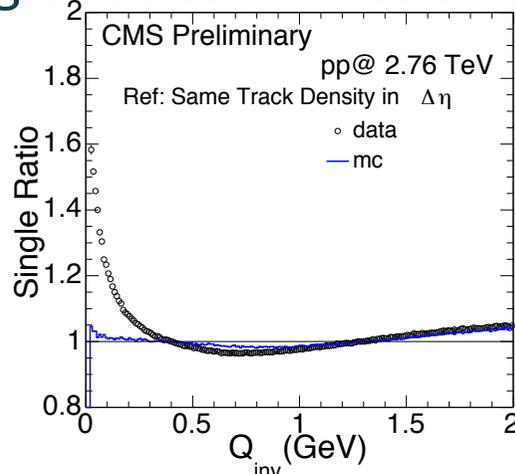

- (in the **LCMS** $\rightarrow k_L = (k_{1L} + k_{2L})/2 = 0$ and cross-term disappears for sources symmetric in longitudinal direction; (*) added to variables in this frame)

PART I

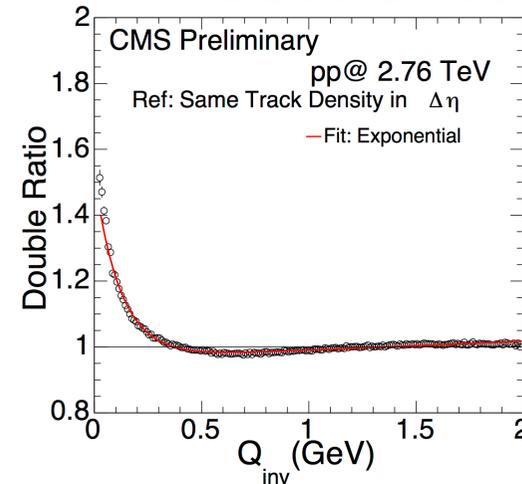

Results in pp collisions with DR technique

1D Single and Double Ratios in pp @ 2.76, 7 TeV

– Single ratios in data and in MC

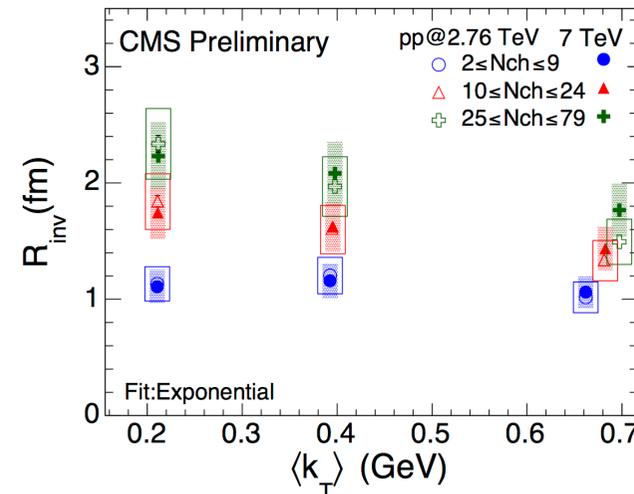

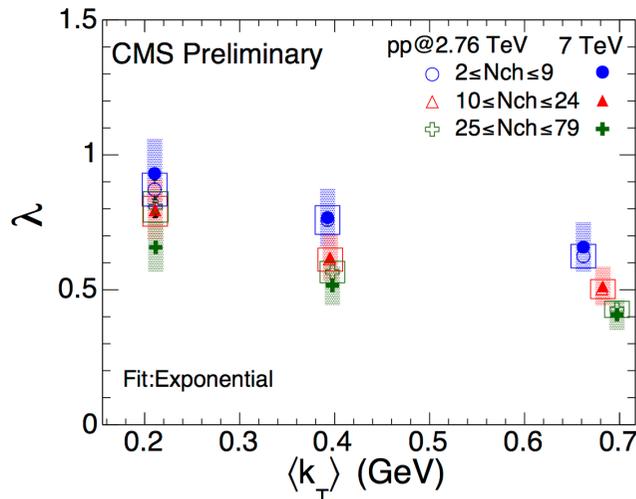

– Double Ratio

□ Differentially in N_{ch} and k_T bins □ Fit function: exponential

□ Uncertainties in plots below

○ statistical → error bars; systematic → shaded and empty boxes

FSQ-13-002-PAS

Radius fit (exponential) parameter vs. N_{ch}

- Curves: $R_{inv} = \xi N_{ch}^{1/3}$ – comparing results at 0.9 TeV, 2.76 TeV and 7 TeV
 - k_T integrated results (error bars: statistical and systematic)
 - $R_{inv} \leftarrow \rightarrow$ increase particle production with increasing collision energy (\approx scaling w/ \sqrt{s})

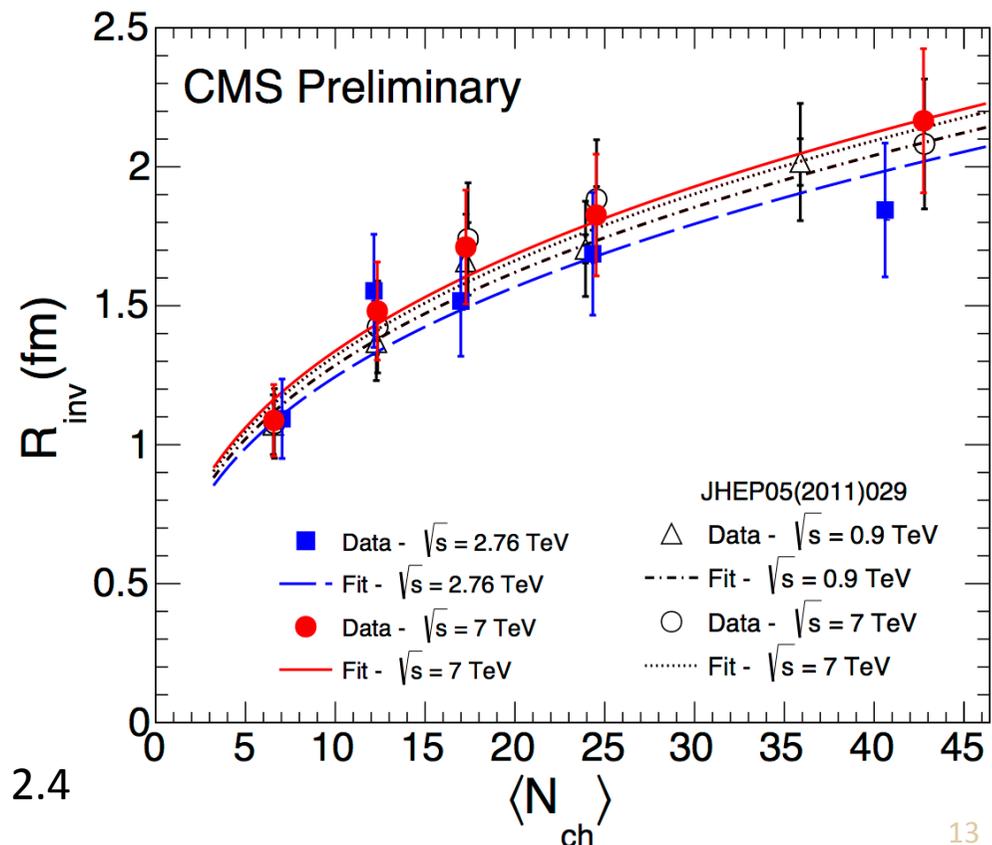

- The proportionality parameter ξ of R as a function of $N_{ch}^{1/3}$

FSQ-13-002-PAS

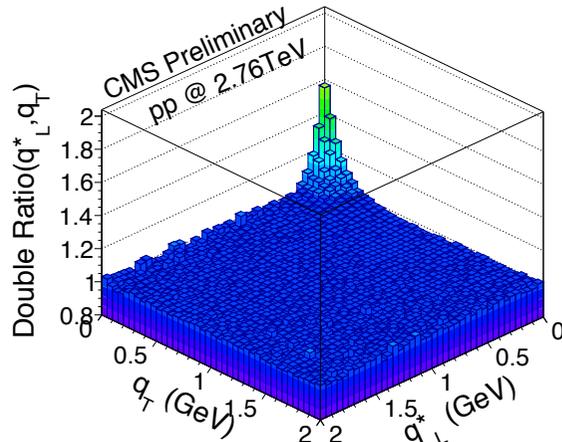

- at 0.9 TeV
 $\xi = [0.597 \pm 0.009]$ (fm)
- at 7 TeV
 $\xi = [0.612 \pm 0.007]$ (fm)
- at 2.76 TeV
 $\xi = [0.578 \pm 0.005]$ (fm)
- at 7 TeV (full dataset)
 $\xi = 0.621 \pm 0.001$

(in ξ : statistical uncertainties only)

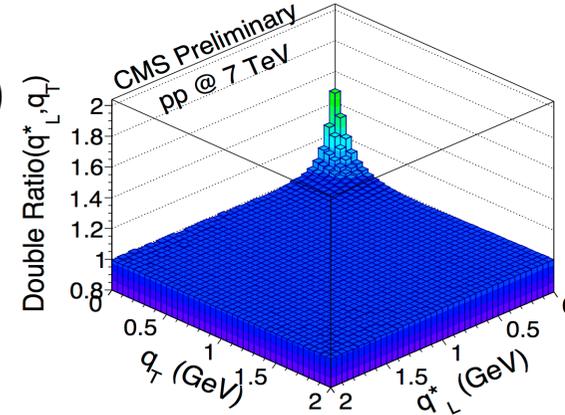

- $\langle N_{ch} \rangle$ is the number of charged tracks integrated in p_T and within $|\eta| < 2.4$

2-D DR(q_T, q_L): k_T and N_{ch} integrated

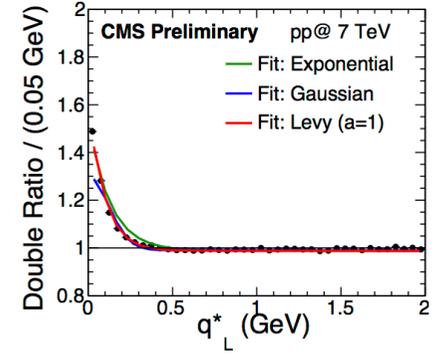

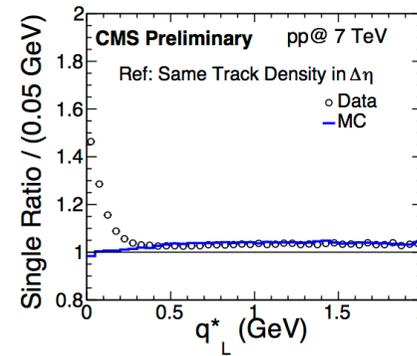

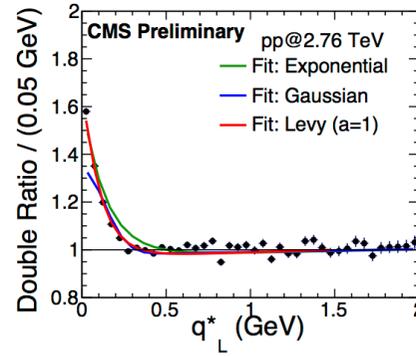

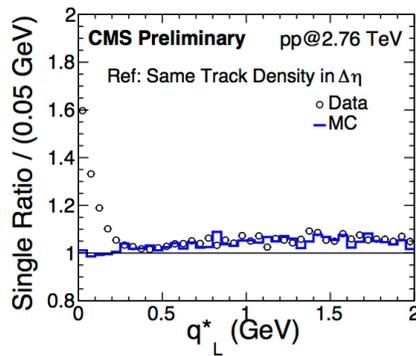

2-D correlation functions (q_T, q_L)

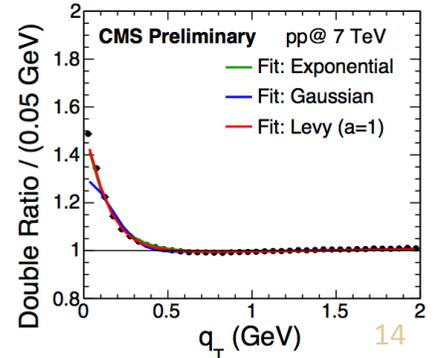

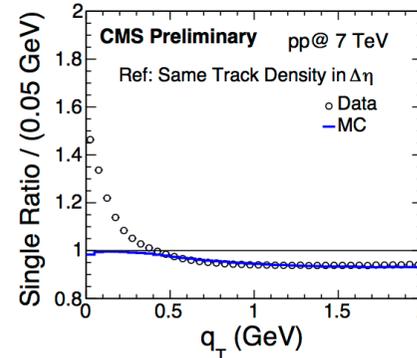

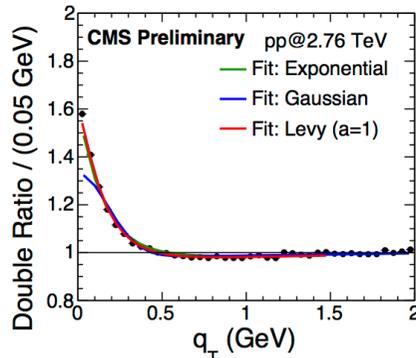

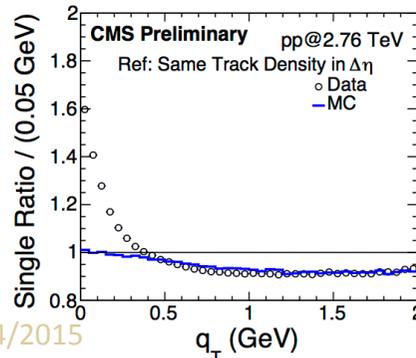

1-D projections

FSQ-13-002-PAS

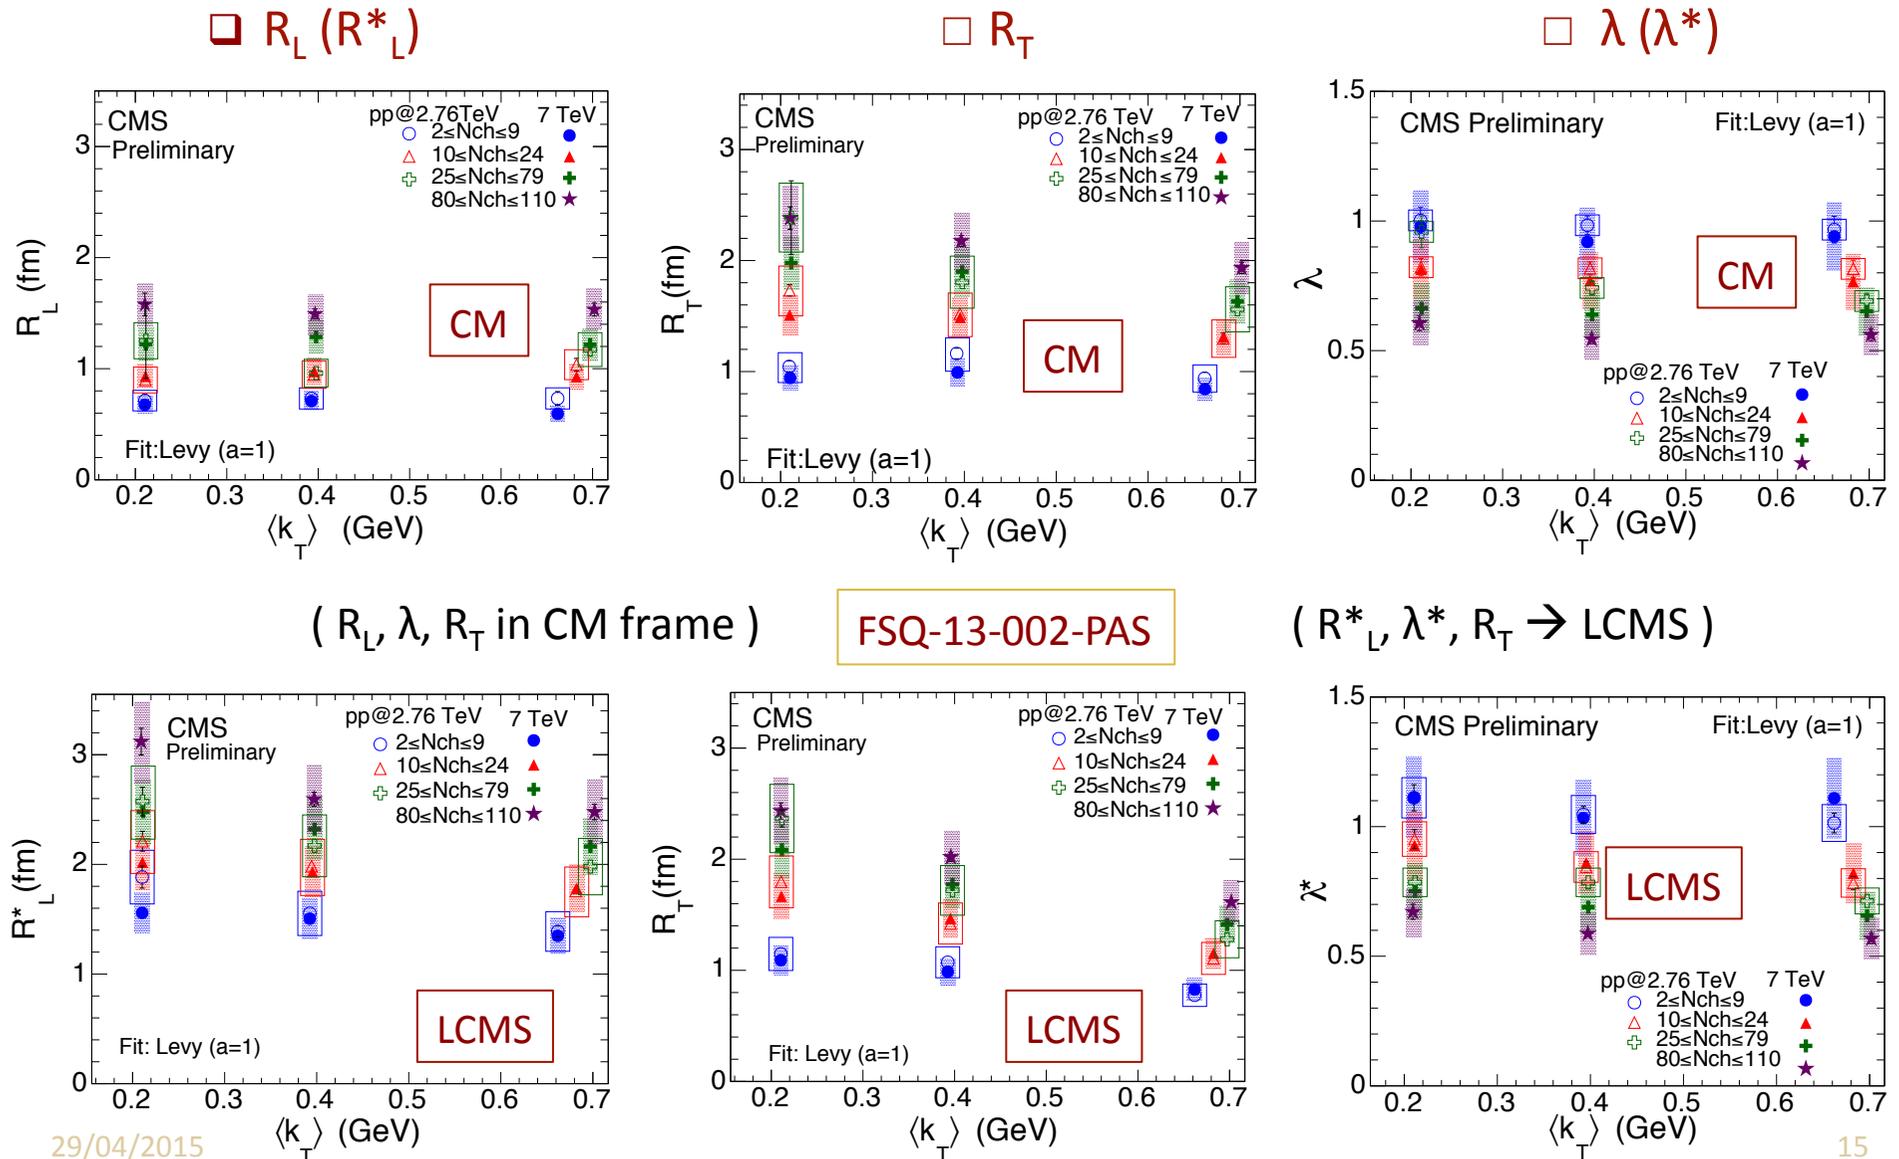

$|q_T| \leq 0.05$ GeV

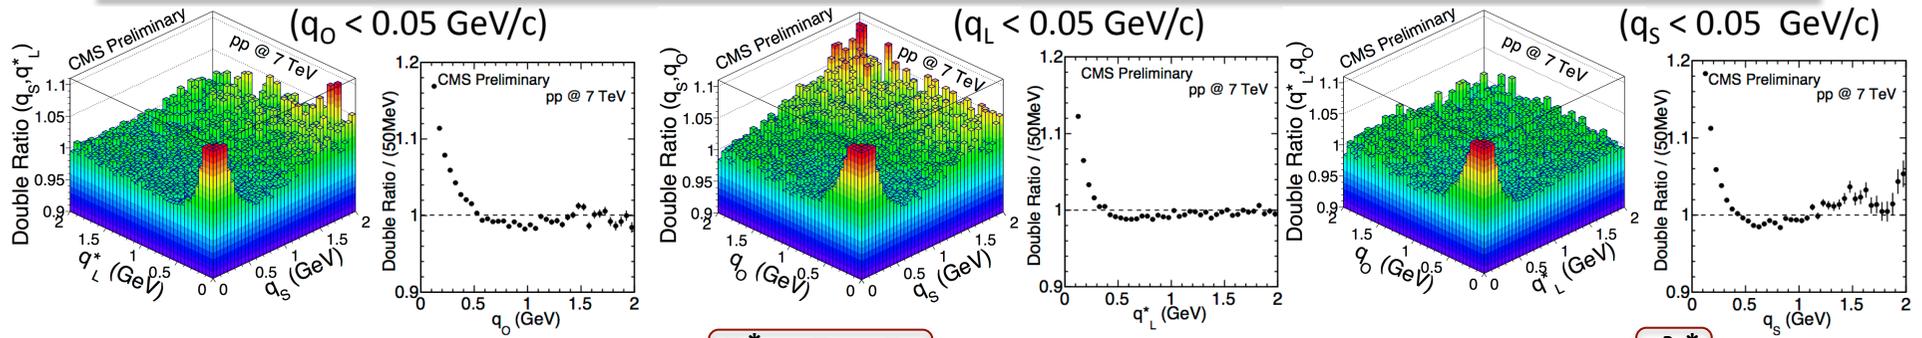

$|q_L^*| \leq 0.05$ GeV

2D results with *stretched exponential* fit function

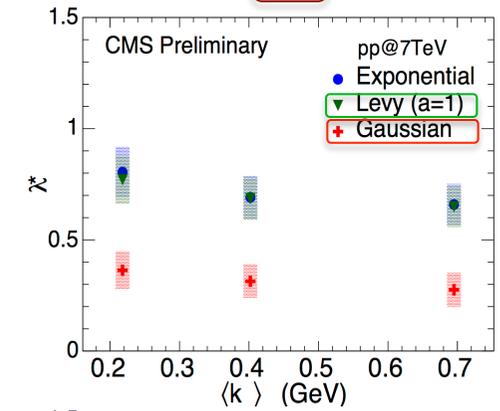

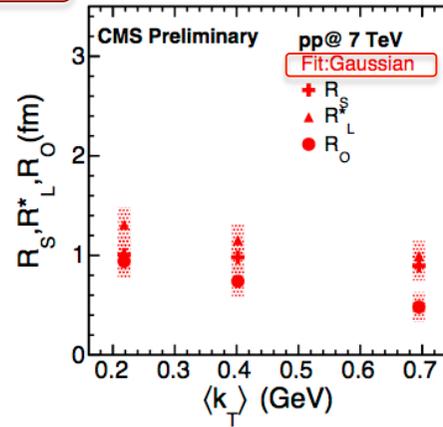

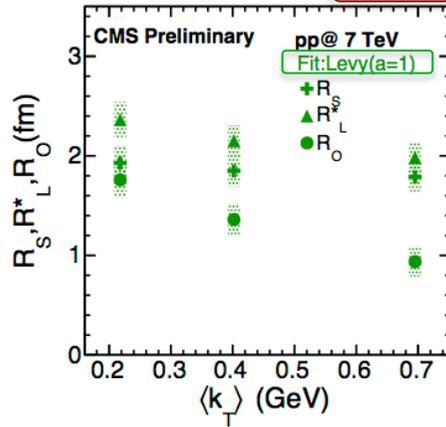

3-D Double Ratios(q_O, q_S, q_L) - LCMS

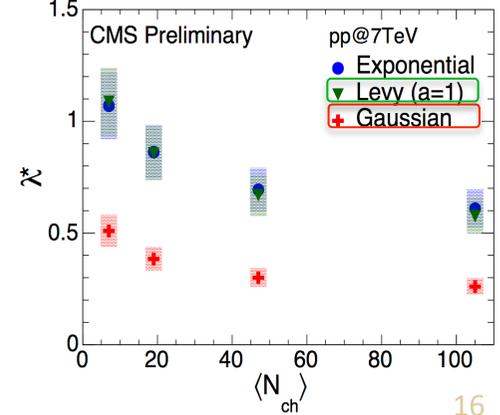

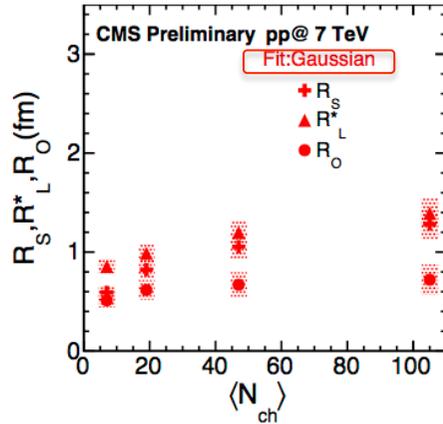

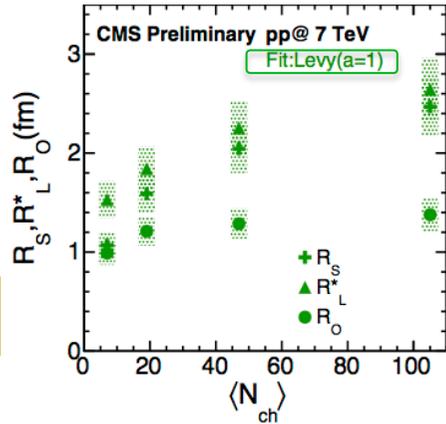

$R_L^*; R_O; R_S$

λ^*

in N_{ch} bins)

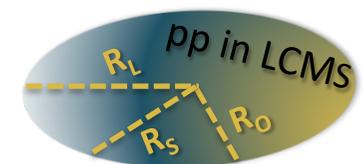

(integrated
in k_T bins)

FSQ-13-002-PAS

Summary and Conclusions – pp with DR technique

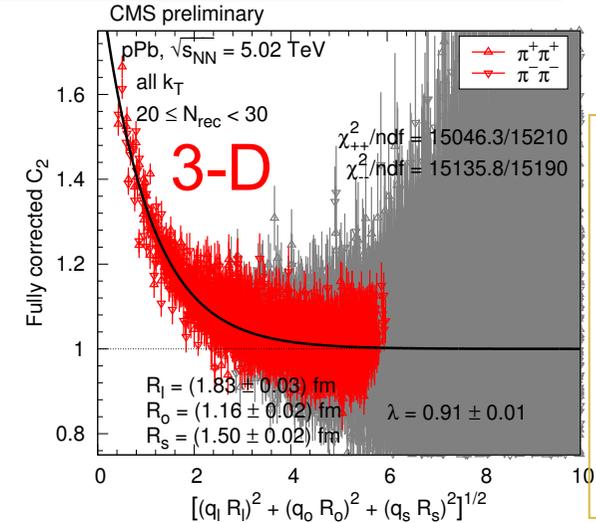

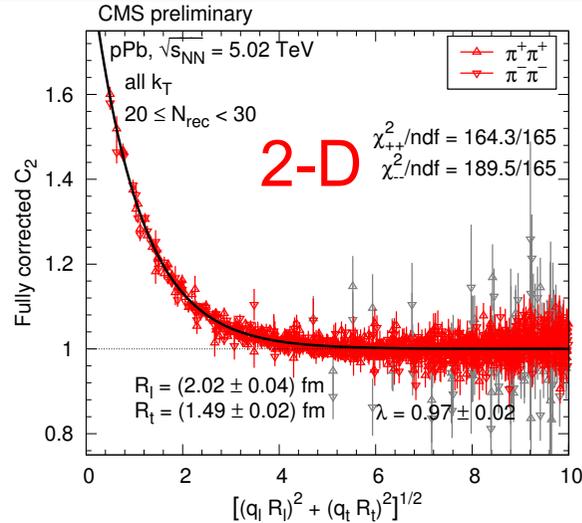

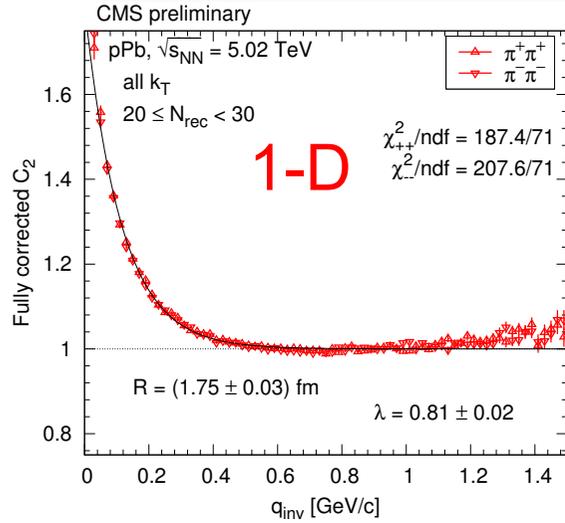

- Fits: Gaussian, simple and *stretched* (Lévy: $\alpha = 1$) exponentials
- Measurements in two reference frames
 - pp collisions (LCMS)
 - CM frame → closer to previous two BEC from CMS, for extending to 2-D and 3D
 - requires additional cross-term (in $q_T q_L$ and in $q_O q_L$)
 - LCMS frame → $k_L = (k_1 + k_2)/2 = 0$ (no cross-term) → comparisons
 - interesting observations when comparing results to those in the CM frame
- Results in 1-D, 2-D, 3D in pp collisions at 2.76 and 7 TeV:
 - $\lambda^{(*)}$ vs N_{ch} : ↓ as N_{ch} ↑ in 1-D, 2-D and 3-D (lower q_O, q_S, q_L then flattens down);
 - $\lambda^{(*)}$ vs k_T : ↓ as k_T ↑ in 1-D; almost flat in k_T in 2-D; almost insensitive to k_T in 3-D
 - Radii fit parameters# increase with multiplicity, decrease with k_T (1D, 2D, 3D)
 - Integrated values in (k_T, N_{ch}) : $R_L^* > R_L$; $R_L^* > R_T$ (in LCMS) in 2D; in 3-D: $R_S > R_O > R_L$ (in CM frame) and $R_L > R_S > R_O$ (in LCMS) (#lengths of homogeneity $1 \leq R_i < 3$ fm in LCMS)
 - CMS-PAS-FSQ-13-002 (<http://cds.cern.ch/record/1754947?ln=en>)

PART II

Multi-systems with data-driven technique

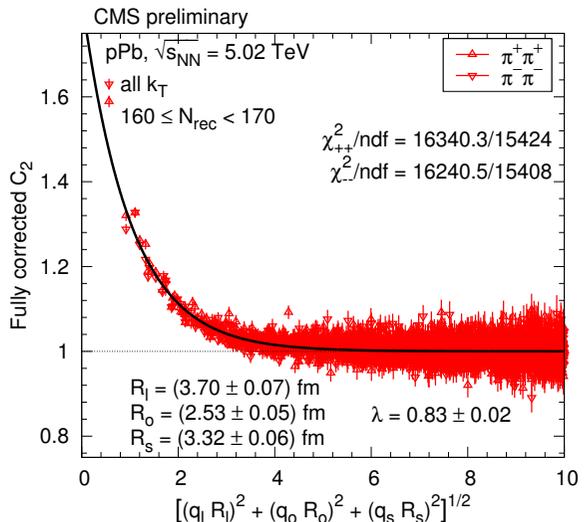

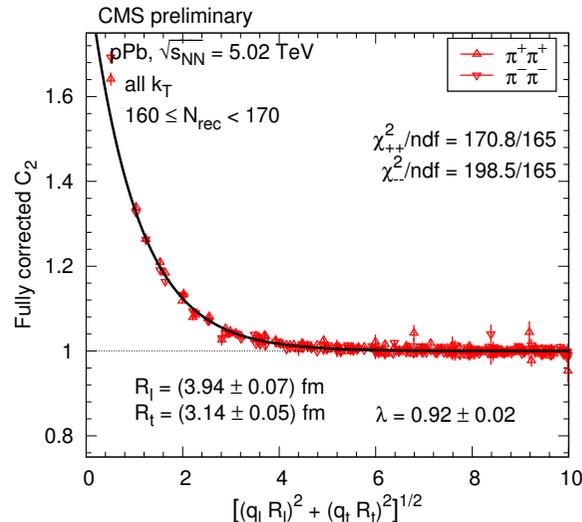

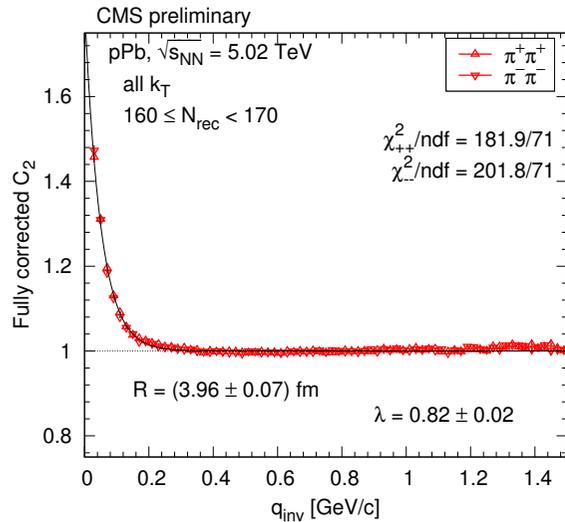

Fully Corrected Correlation Functions

$$C_{BE}(q_{inv}) = 1 + \lambda \exp[-q_{inv} R]$$

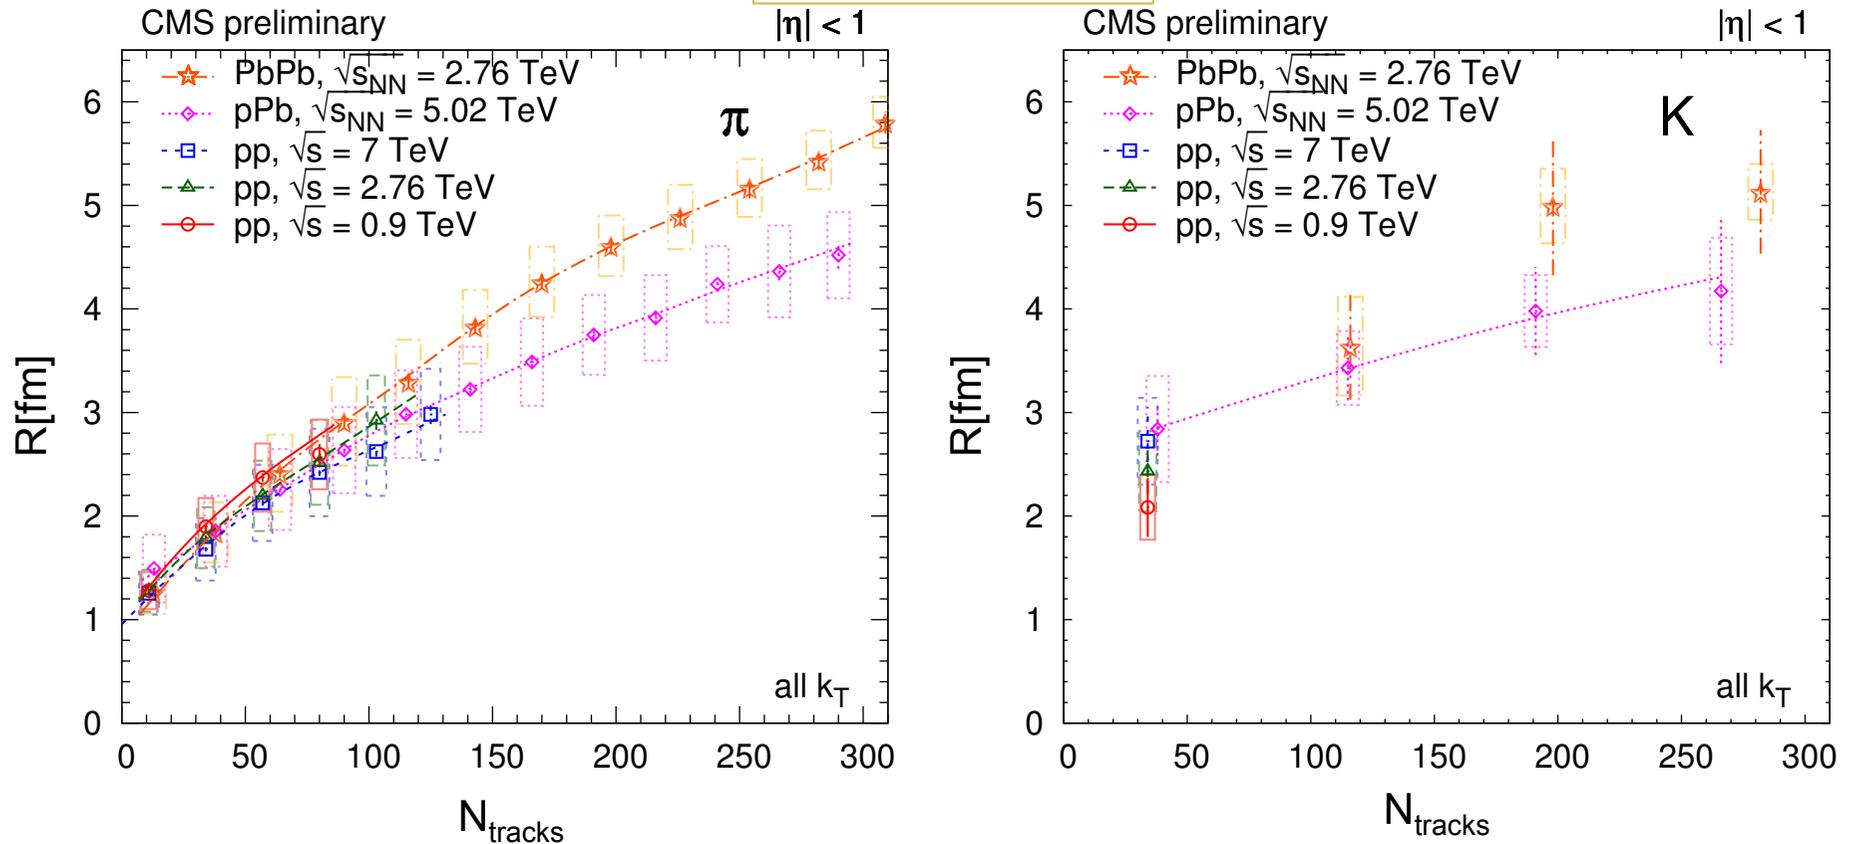

$$C_{BE}(q_l, q_t) = 1 + \lambda \exp[-\sqrt{(q_l R_l)^2 + (q_t R_t)^2}]$$

$$C_{BE}(q_l, q_s, q_o) = 1 + \lambda \exp[-\sqrt{(q_l R_l)^2 + (q_s R_s)^2 + (q_o R_o)^2}]$$

1-D BEC results: Pions & Kaons

CMS PAS HIN-14-013

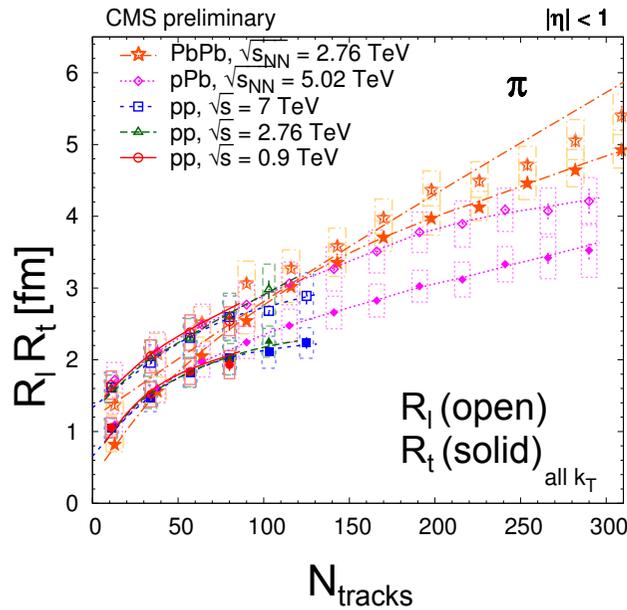

– One-dimension $C_{BE}(q_{inv})$ – exponential fit

- ❑ R for pions and kaons \rightarrow increase with N_{tracks} for all systems and center-of-mass energies
- ❑ Small increase for kaons compared to pions: long lived resonances + rescattering

2- and 3-D BEC results: Pions

CMS PAS HIN-14-013

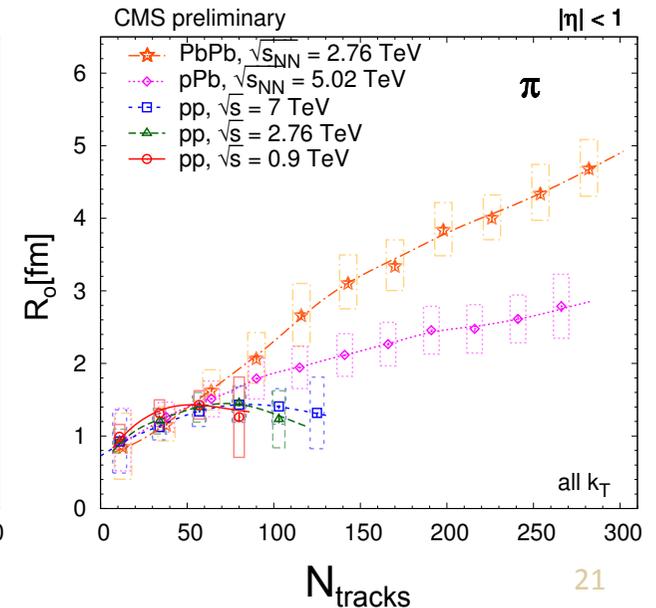

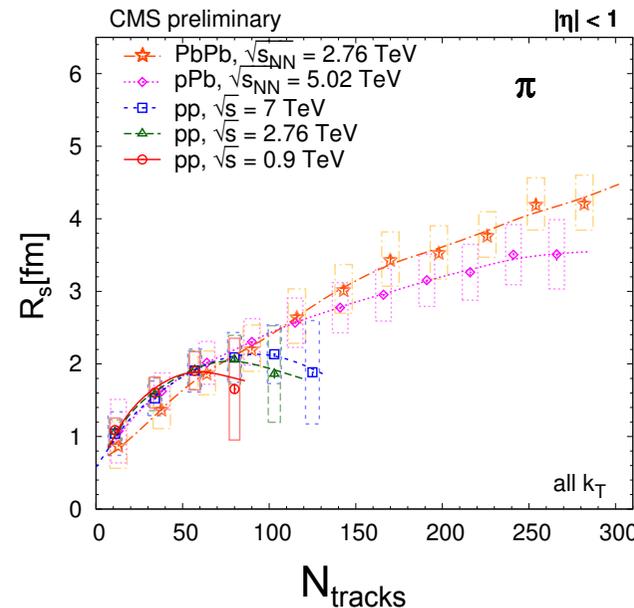

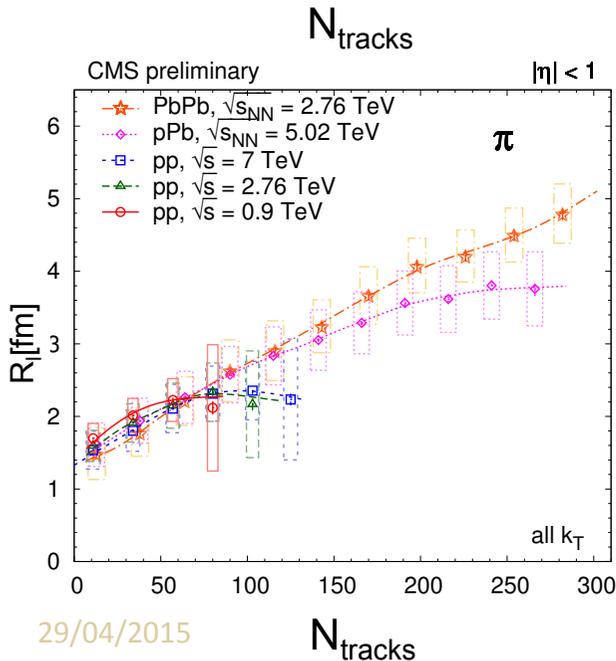

2-D $C_{BE}(R_l, R_t)$ (stretched exponential fit)

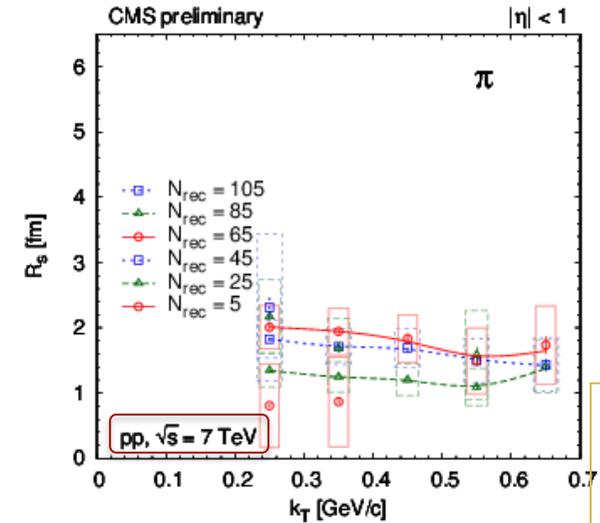

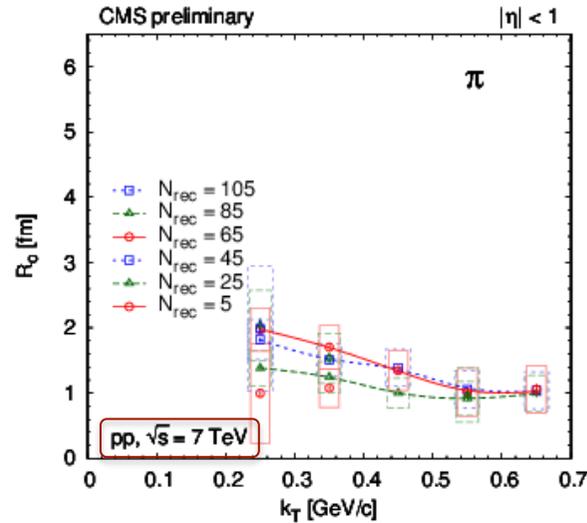

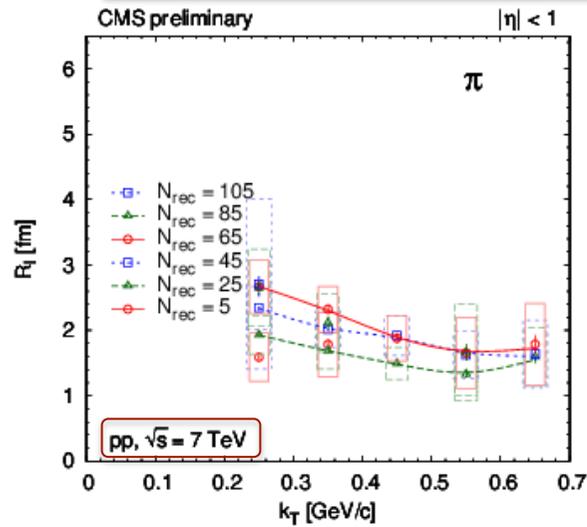

- For pp and pPb: $R_l > R_t \rightarrow$ elongated source along beam
- For peripheral PbPb: $R_l \approx R_t \rightarrow$ spherical source

3-D $C_{BE}(R_l, R_s, R_o)$ (stretched exponential fit)

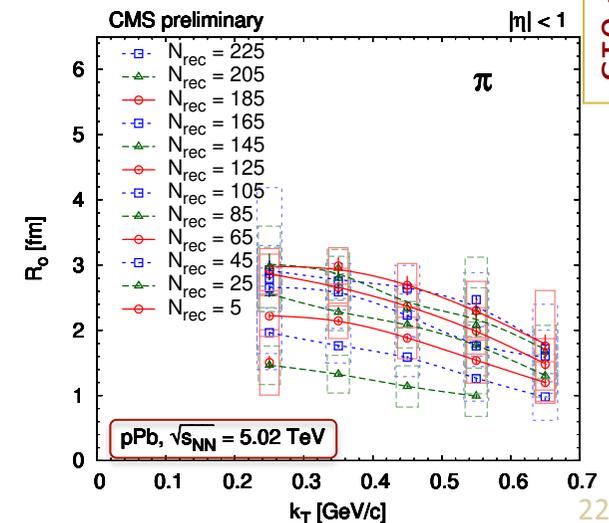

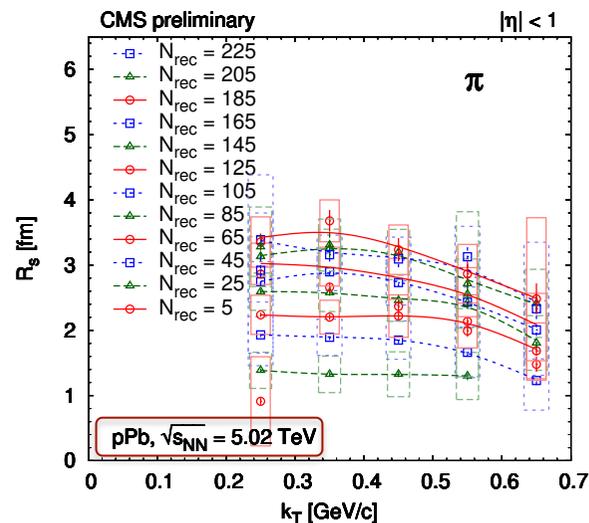

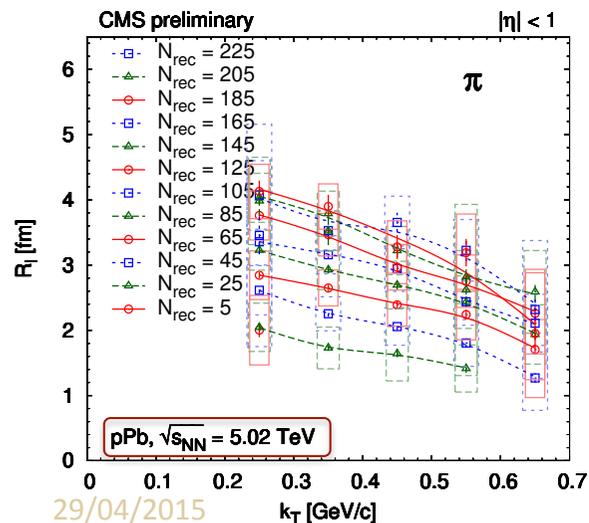

- For pp and pPb: $R_l > R_s > R_o \rightarrow$ elongated source in beam direction
- For peripheral PbPb: $R_l \approx R_s \approx R_o \rightarrow \approx$ spherical source
- Large difference in R_o in PbPb and pPb \rightarrow possibly due to lifetime of the source

The k_T -dependence in pp and pPb

- $R_l, R_s, R_0 \rightarrow$ decrease with increase in k_T (stretched exponential fit)
- Similar behavior for all system and at all center of mass energies

CMS PAS HIN-14-013

Scaling Properties in N_{tracks} and k_T

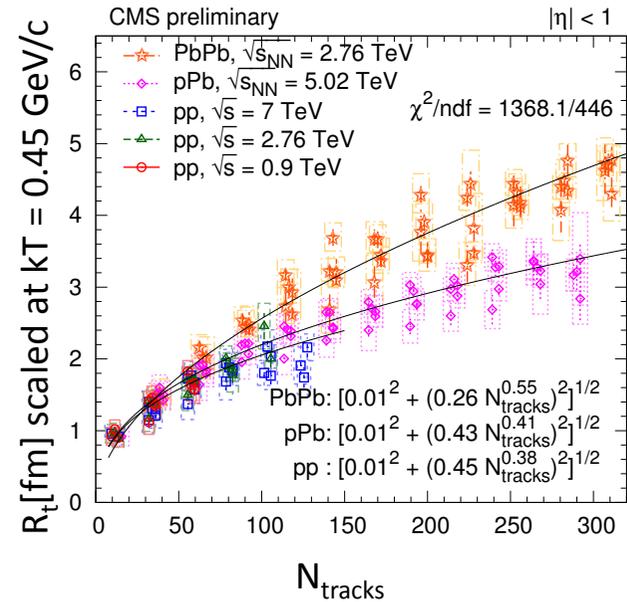

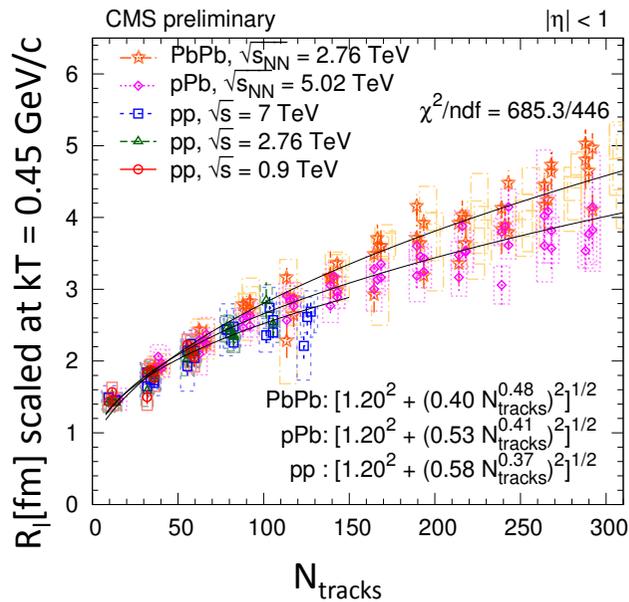

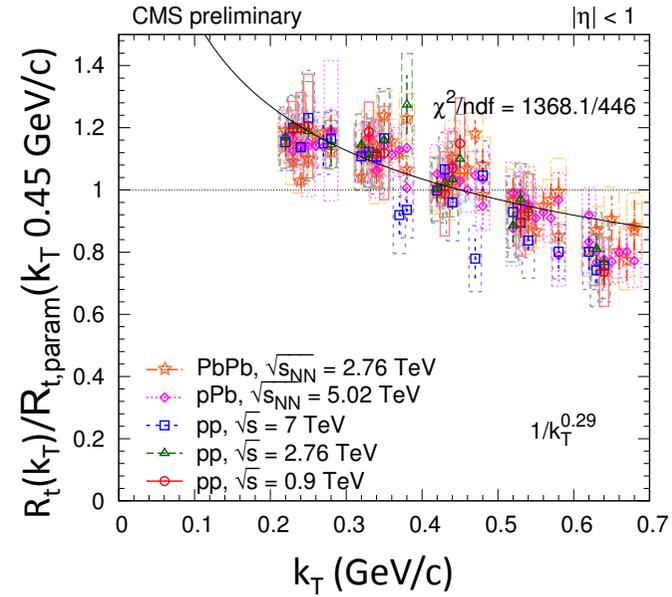

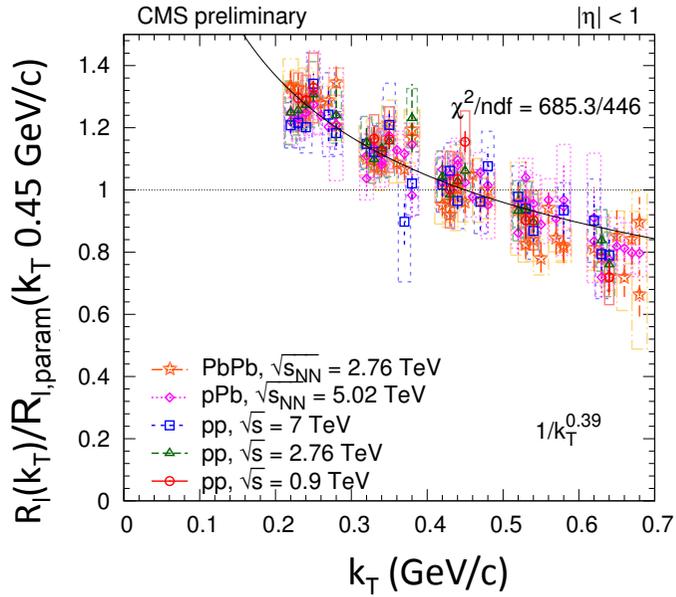

– Pion radius fit parameters (lengths of homogeneity)

- ❑ Increase with increasing N_{tracks}
- ❑ Decrease with increasing k_T
- ❑ Dependence on N_{tracks} and k_T factorizes:

$$R_{\text{param}}(N_{\text{tracks}}, k_T) = [a^2 + (bN_{\text{tracks}}^\beta)^2]^{1/2} \cdot (0.2\text{GeV}/c/k_T)^\gamma$$

- For a given R component $\rightarrow a$ (minimal radius) and γ are kept the same for all collision systems
- Identical parameters used for the three proton-proton energies
- All five systems are fit simultaneously
- ❑ Plotting as a function of N_{tracks}
 - Radius is scaled to $R_{\text{measured}} * (1/0.45^\gamma) / (1/k_T^\gamma)$
- ❑ Plotting as a function of k_T
 - $R_{\text{measured}} / (R_{\text{param}}$ at the same N_{tracks} but at $k_T=0.45)$

Scaling properties in N_{tracks} and k_T : 2-D illustration

CMS PAS HIN-14-013

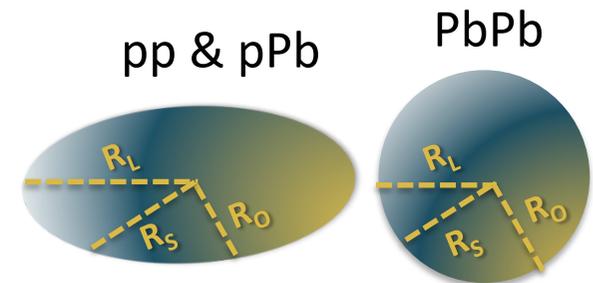

Summary & Conclusions – multi-systems (data-driven technique)

- Measured BEC \rightarrow best described by stretched exponential function
- Radius parameters \rightarrow from 1-5 fm

- All the radii increase smoothly with N_{tracks}
- Highest values for pPb and peripheral PbPb (large system)
- Small increase for kaons compared to pions
- Radius parameter (lengths of homogeneity) decrease with increasing k_T
- Radius parameters for pp and pPb are similar the same for N_{tracks}

- For two- and three-dimensions in pp and pPb

- $R_l > R_t$
 - $R_l > R_s > R_o$
- } source elongated along beam direction
in pp and pPb collisions

- In peripheral PbPb collisions: R_o different than in pp, pPb \rightarrow possibly indicating different life-time of the source created in such collisions

Systematic Uncertainties – Summary

Systematical Uncertainties				
\sqrt{s}	2.76 TeV		7 TeV	
Origin of Systematics	λ	R_{inv} (fm)	λ	R_{inv} (fm)
Monte Carlo tune	0.032	0.160	0.032	0.160
Reference Sample	0.009	0.047	0.051	0.188
Coulomb Corrections	0.016	0.009	0.018	0.020
Charge Dependence	0.006	0.012	0.007	0.006
Pileup filter	5.0 e-4	0.011	0.001	0.0025
Track Cuts	0.014	0.119	0.014	0.119
Total	0.040	0.206	0.065	0.275

Comparing $R_L^{(*)}$ fit parameter in 2-D and 3-D

- Longitudinal fit parameters should be the similar in 2-D and 3-D
 - indeed, R_L and R_L^* lengths of homogeneity \rightarrow close values
 - increase with N_{ch} and scales in energy, similar to the 1-D case

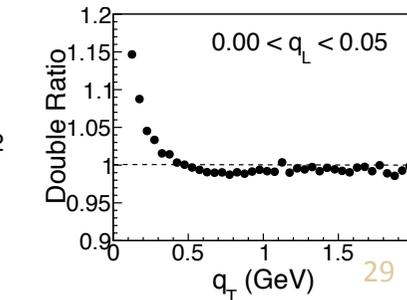

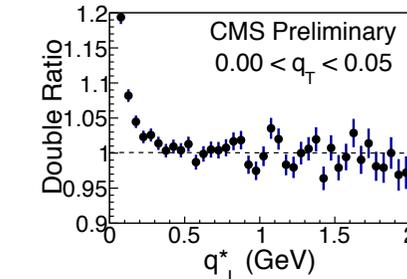

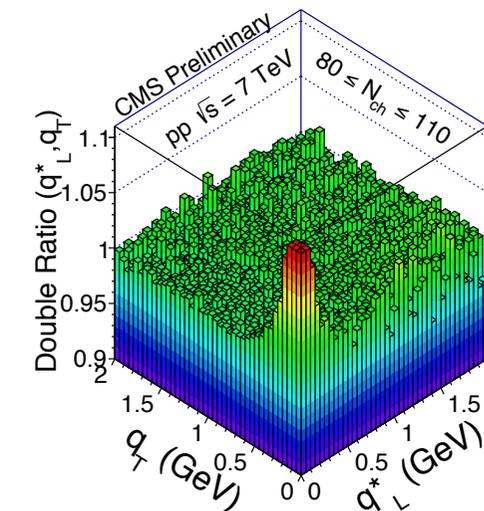

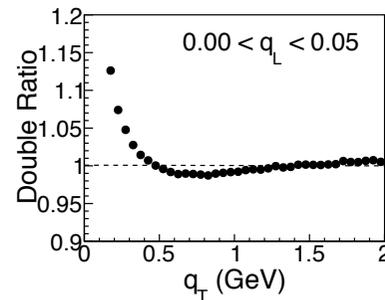

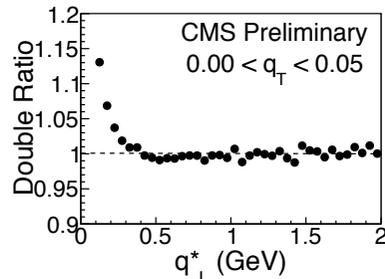

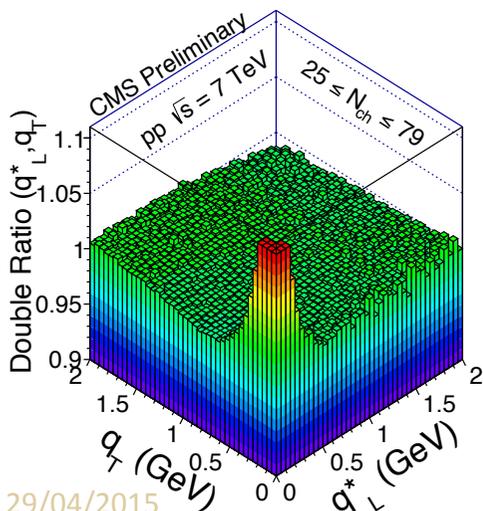

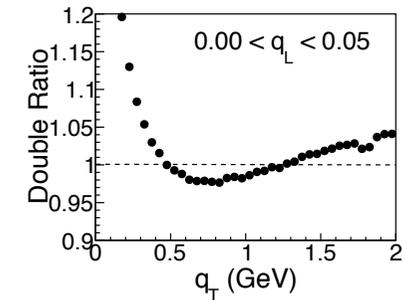

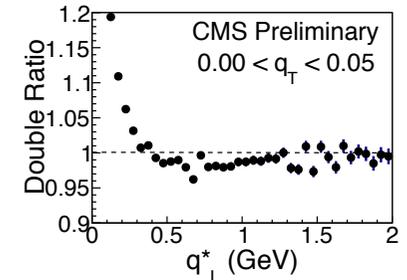

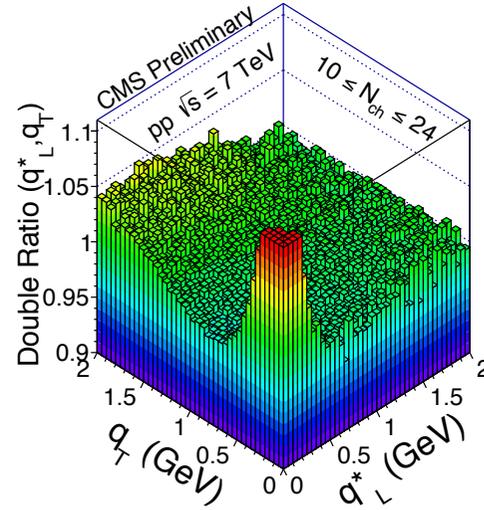

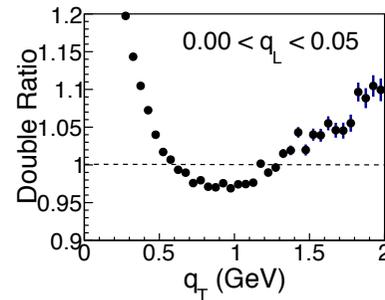

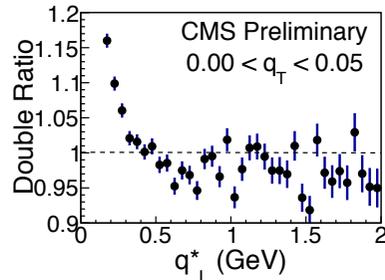

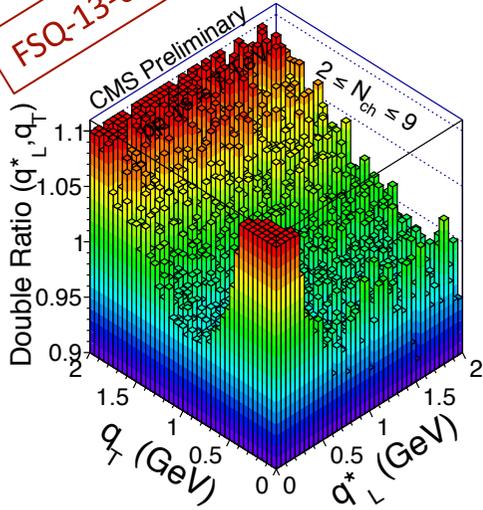

FSQ-13-002-PAS

The anticorrelation in 2-D DR (q_T, q_L) - LCMS

○ Zoomed DR(q_T, q_L) integrated in k_T and N_{ch}

FSQ-13-002-PAS

Extracting results: fit functions – 1D

- Symmetric Lévy stable distribution with index of stability a

$$\mathcal{R}(Q_{\text{inv}}) = C[1 + \lambda e^{-(Q_{\text{inv}} R_{\text{inv}})^a}] (1 + \delta Q_{\text{inv}})$$

- relative and average momenta of the pair

$$Q_{\text{inv}}^2 = -(k_1^\mu - k_2^\mu) \cdot (k_{1\mu} - k_{2\mu}) = m_{\text{inv}}^2 - 4m_{\pi^2}$$

$$k_\mu = \frac{k_{1\mu} + k_{2\mu}}{2}$$

- Limit $a=1 \rightarrow$ exponential function

Fourier transform of Cauchy-Lorentz source

$$\mathcal{R}(q) = C[1 + \lambda e^{-QR}] (1 + \delta Q)$$

$$S(r) = \frac{1}{2\pi^2} \frac{R}{r^2 + (\frac{1}{2}R)^2}$$

- Limit $a=2 \rightarrow$ Gaussian distribution

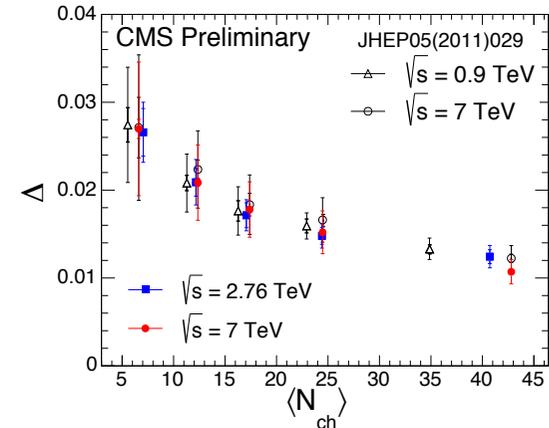

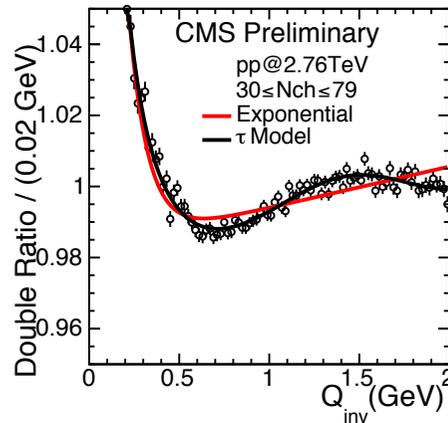

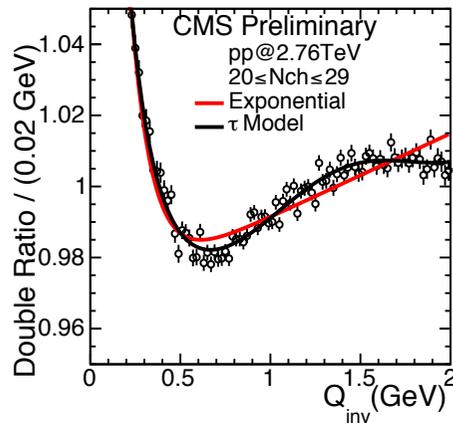

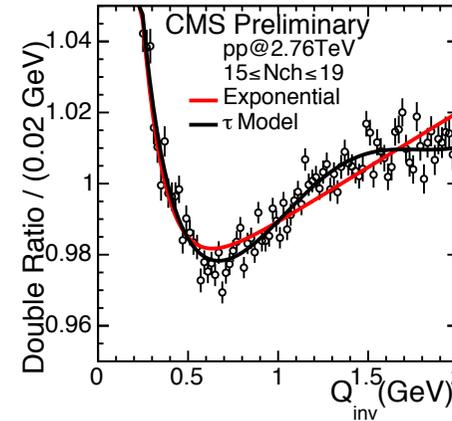

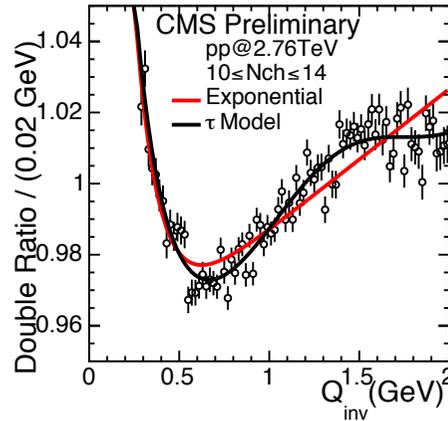

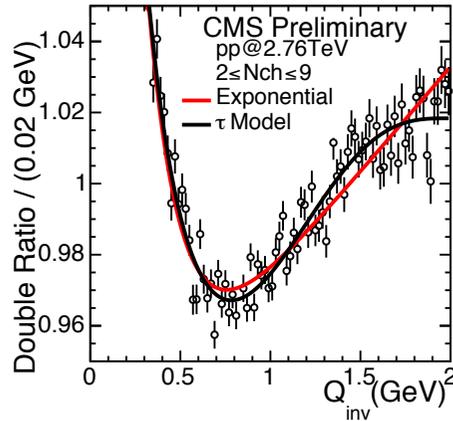

Fourier transform of Gaussian source

$$\mathcal{R}(q) = C[1 + \lambda e^{-Q^2 R^2}] (1 + \delta Q)$$

$$\frac{1}{(\sqrt{2\pi}R)^3} e^{-r^2/(2R^2)}$$

Double Ratios (Q_{inv}): study of the anticorrelation

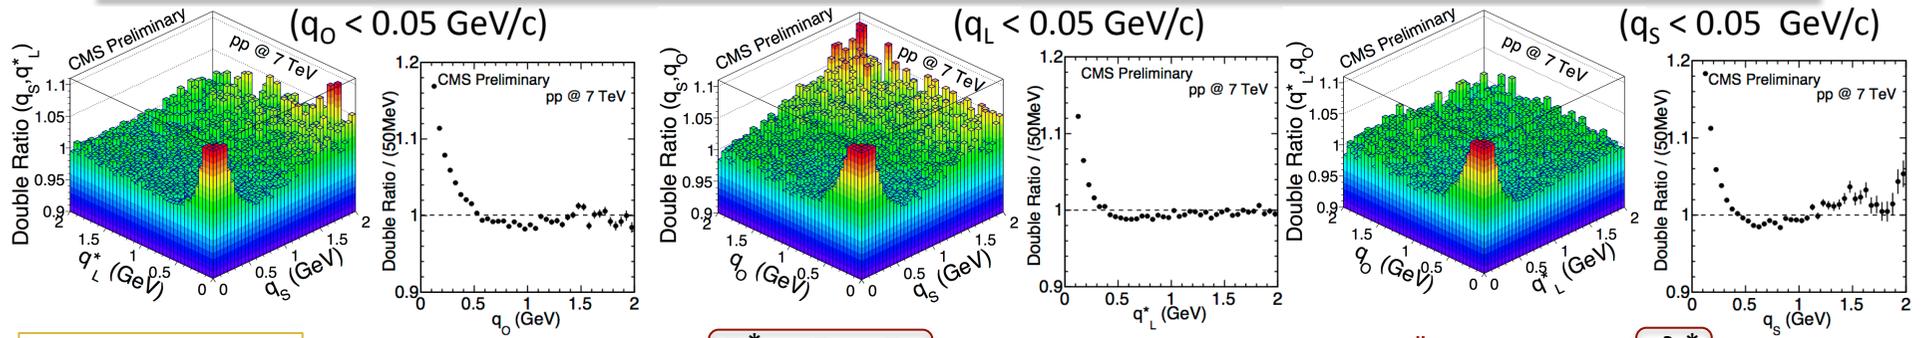

FSQ-13-002-PAS
