- Summary

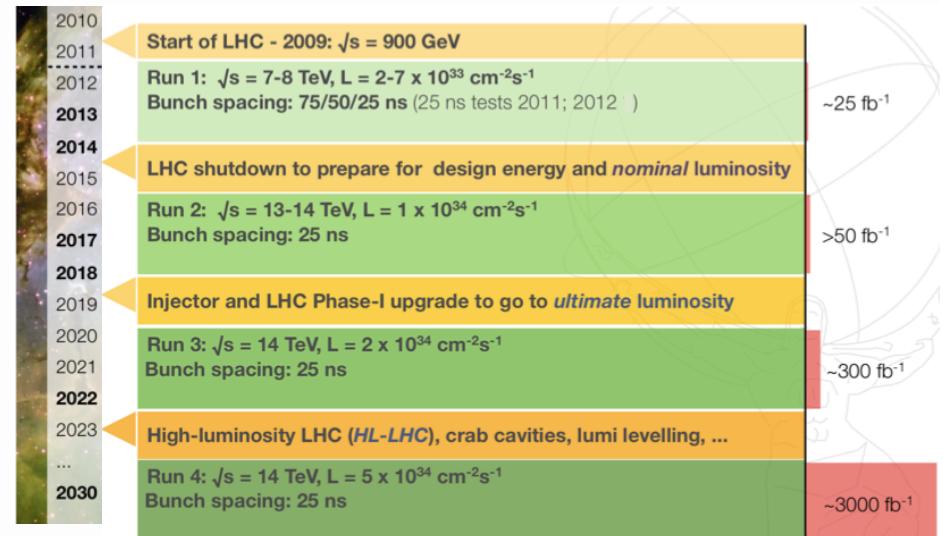

GridPP Mission

Mission: To deliver resources to the UK and worldwide particle physics community in accordance with the WLCG MOU, by means of a large-scale computing Grid in the UK.

- 2001 GridPP1 - *From Web to Grid*
- 2004 GridPP2 - *From Prototype to Production*
- 2007 GridPP2+ (6-month extension)
- 2008 GridPP3 - *From Production to Exploitation*
- 2011 GridPP4 - *Computing in the LHC era*
- 2015 GridPP4+ (One year extension)
- 2016 GridPP5 - *Computing beyond the Higgs*

The UK kick-started WLCG in 2002 with a £5.6m investment.

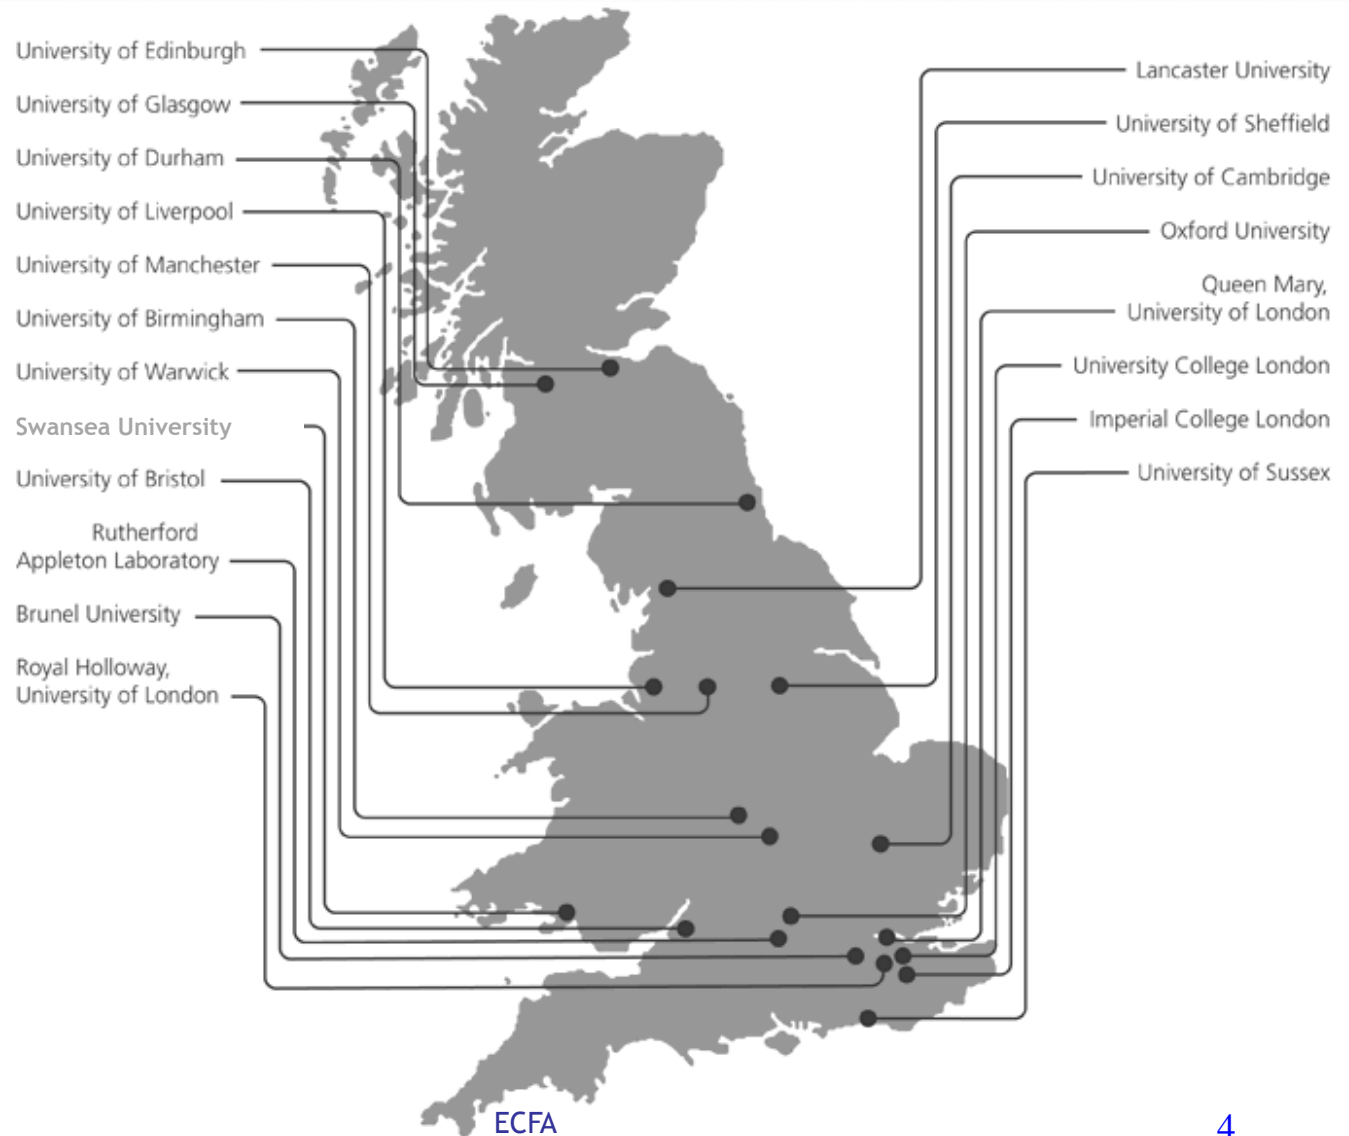

$\int L dt$

GridPP is a collaboration of 19 UK universities, and the Rutherford-Appleton Laboratory (STFC).

It has built and operates a distributed computing Grid across the UK for particle physicists.

Janet6 Network

Janet6 rolled out 1 year ago: Optical 40/100G national academic network.

- Long term - 10+ years for fibre leases
- Transmission equipment refresh after ~7+ years
- Roadmap to next capacity increment per wavelength (400G ?)
- More flexible optical architecture
- Direct management of optical infrastructure
- Huge capability for additional capacity
- Continued integration of Regions

GridPP Resources

RAL Tier-1:

- 13,500 Logical CPU
- 10 PB Disk
- 13 PB Tape

Distributed Tier-2:

- 50,000 Logical CPU
- 20 PB Disk

Together, consistently delivered 12% of WLCG resources over the last decade.

Pledges and Delivery

UK pledges and delivers the UK authorship fraction of the (scrutinised and approved) Global LHC resource requirements.

- 10% of ATLAS (12.5% of Tier-1 country authors).
- 4% of CMS (7% of Tier-1 country authors).
- 19% of LHCb (31% of Tier-1 country authors).
- 2% of ALICE.

UK delivery exceeds all these number due to additional non-GridPP funded resources contributed by the participating institutes and due to highly-efficient operations.

Grid Production Tools

What was learned

- found one hole in the coverage for low momentum muons from pion decays, deflected at large angle by the spectrometer magnet. A small muon detector was added outside the previous acceptance region
- found one hole in the coverage for high momentum pions slightly escaping the beam pipe downstream the hadron calorimeters and muon detector. A small hadron calorimeter was added just outside the beam pipe
- the digitisation and reconstruction software was improved after training on the previous MC production and comparison with test run data
- background studies have been refined trigger studies have been started
- some weaknesses in the MC has been identified and corrected, both from the software and the physics point of view

Next 2 gLite-based Grid Production System

Two serious gaps in the detector acceptance that would have compromised the measurement

5 UK
Production/
200,000
29 TB of data on CASTOR.

Data produced was used for

Improving the detector geometry/acceptance, the digitisation and reconstruction software, refining the background studies and the trigger; fixing problems in our MC software.

Long term prospects

Some components will be outdated in the not so far future: support for WMS is shrinking within the Grid community, LFC is being phased out; new and more capable frameworks are available.

Convergent evolution seen in hundreds of genes

Bats and dolphins may have developed echolocation via similar mutations.

Erika Check Hayden

04 September 2013

Rights & Permissions

hundreds of genes

...ir mutations.

...e without the genetic sequence data now available for dozens newly sequenced bat genomes — and the use of the Queen a powerful computing grid. GridPP is normally used to churn ollider at CERN, Europe's particle-physics lab near Geneva in r's team roughly a month to perform its analyses using the desktop computer, Parker says.

Bottlenose dolphins can detect prey with a sonar-like trick similar to that used by bats — and the similarity extends to the genetic underpinnings of this ability.

Flavour changer: Genome could enhance tomato taste

By Matt McGrath
Science reporter, BBC World Service

The successful sequencing of the tomato genome will lead to tastier varieties within five years say scientists.

They believe that the elusive flavour of home grown tomatoes will by then be widely available in supermarkets.

Writing in the journal Nature, the researchers say the genetic information could reduce the need for pesticides.

The authors believe the genome will also boost conventional breeding techniques over genetic modification.

Can the genome sequence pave the way for a return of the home grown taste

Can the genome sequence pave the way for a return of the home grown taste

Global Services used by WLCG and EGI:

- Operates/maintains the GOCDB (semi-static database of site capabilities).
- Operates/maintains the APEL database (dynamic database of usage accounting information).

International Leadership:

- Leadership role in security policy development and international coordination.
- Leadership of the EGI CSIRT (operations security group in Europe).
- Leadership of WLCG security vulnerabilities group.
- Leadership of the IPv6 HEPiX working group.
- Co-chair WLCG Operations coordination.
- Chair many working groups (e.g. Cloud Traceability; Data management; wn+SL6 migration; perfSONAR; IPV6 deployment).

- GridPP5 proposal submitted in early 2014 for a 4 year project; could not be funded at that time.
- One year extension granted to GridPP4 for 2015-2016.
- Procurement is well underway that will deliver the April 2015 hardware pledges.
- The GridPP4 extension and will enable procurement for hardware to meet the April 2016 pledges.
- The GridPP5 proposal needs to be revised/re-submitted in early 2015 to cover funding of hardware and manpower over the period April 2016 - 2019.

Abstract

This document contains input from GridPP to the Strategic Review Panel. We respond to the request for "Flat-Cash" and "50% of Flat-Cash" scenarios to cover the provision of Grid Computing for the LHC experiments and other groups, for the period April 2015 to March 2019. This period covers the LHC Run-2 where an increase in computing resources of a factor of 2.5x is required to exploit the last two decades of investment in the LHC programme.

Future Requirements

- Experiments resource planning is shaped by flat-cash constraints.
- Computing models have evolved significantly for Run-2 based on experience:
 - Increased use of network.
 - Decrease in number of copies of data.
 - Better design/integration reduces CPU and intermediate data requirements.

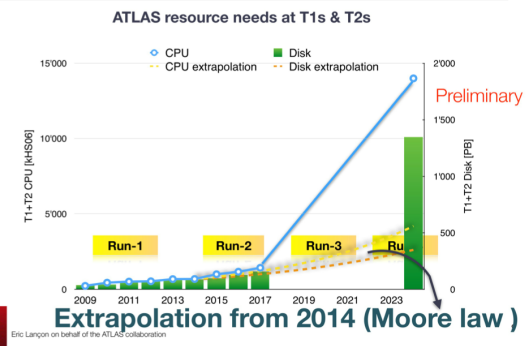

Future Challenges

- Run-2 data is expected to increase in both volume (x2-3) and complexity (PU \rightarrow 50);
- Increasingly difficult to make use of the technical advances that are maintaining Moore's Law growth.
- Increasingly hard to find big gains in the computing models (copies of data are now minimal; efficiencies are high; etc.)
- Preparations for beyond Run-2 must start.
- Millions of lines of legacy code need to be parallelized; Memory-use and disk-access needs optimisation; Monte-Carlo simulation strategies need to make more flexible use of fast simulation; etc.

ATLAS: projections
Run-4 (with 2014 performances)

- Need to worry about disk and CPU usage for HL-LHC as well as access to disk (IO and capacity!).

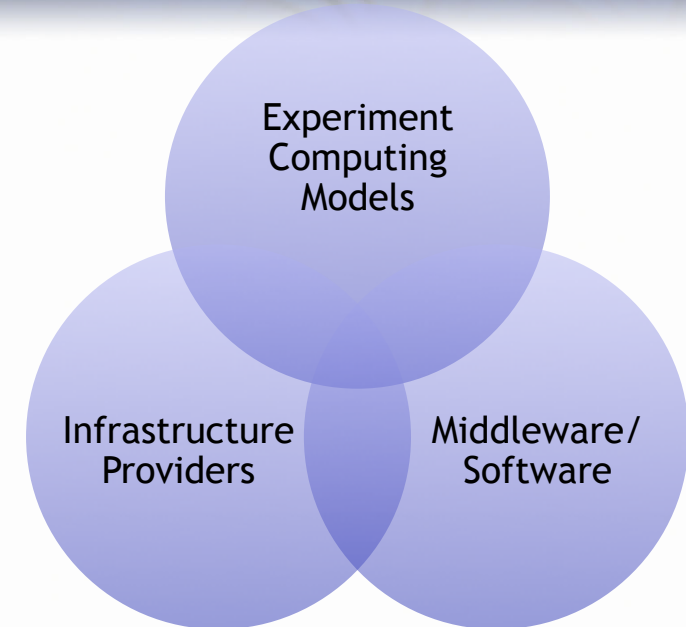

GRID CPU Consumption

Addressing Challenges

- Require a continued close partnership between those developing the Experiment computing models, the middleware/software developers, and the infrastructure developers/operators.
- Long-term planning and large-scale testing are required.
- Manpower and hardware resources are required above those needed to just to operate the service.

The UK is active in:

- Preparing for IPV6.
- Security policy development.
- Testing large-scale deployment of CEPH as a successor to CASTOR for disk storage.
- Support and development of the DPM project for Tier-2 disk management.
- Cloud developments - leading CMS developments; major roles on ATLAS and LHCb.
- Development of operational security models for Cloud technology.
- Leading role in FIM4R activity towards use of federated identities.
- VAC and VCycle - simplifying Grid sites using cloud technologies.

The UK Ecosystem

Accelerating the product discovery process at Unilever

Unilever is taking advantage of the STFC Hartree Centre expertise in high-performance computing (HPC) to model key ingredients of liquid home and personal care products to structure everyday liquids.

The challenge
The challenge was to model the molecular structure of a complex liquid mixture, such as a liquid soap, to understand its physical properties. This required a high level of accuracy and computational power to simulate the interactions between the different molecules in the mixture.

The solution
The solution was to use the STFC Hartree Centre's high-performance computing resources to simulate the molecular structure of the liquid mixture. This allowed Unilever to understand the physical properties of the mixture and to optimize its formulation.

Accelerating product design and development at Jaguar Land Rover

Collaborative expertise and access to supercomputing facilities has enabled Jaguar Land Rover to accelerate product design and development at Jaguar Land Rover.

Smaller, affordable particle accelerators for healthcare and security

Tech-X Corporation has accessed the high-performance computing (HPC) facilities at the Science and Technology Facilities Council (STFC) Hartree Centre to accurately simulate particle beams of a novel next generation accelerator prototype.

The challenge
The challenge was to simulate the behavior of a novel particle beam, which is a key component of a next-generation accelerator. This required a high level of accuracy and computational power to model the complex interactions between the particles and the accelerating fields.

The solution
The solution was to use the STFC Hartree Centre's high-performance computing resources to simulate the behavior of the particle beam. This allowed Tech-X to optimize the design of the accelerator and to predict its performance.

Supporting new product design at Bentley

Supporting new product design at Bentley. Bentley is using the STFC Hartree Centre to support its product design efforts.

New processes emerging for more economical oil extraction

Researchers at Lancaster University are using the supercomputing capability of the Hartree Centre to accurately simulate the flow of complex fluids to improve oil extraction techniques.

The challenge
The challenge was to simulate the flow of complex fluids, which is a key component of oil extraction. This required a high level of accuracy and computational power to model the complex interactions between the fluids and the extraction equipment.

The solution
The solution was to use the STFC Hartree Centre's high-performance computing resources to simulate the flow of the complex fluids. This allowed the researchers to optimize the design of the extraction equipment and to predict its performance.

The benefits
Using high performance computing, simulation and applying the computational chemistry approach, the researchers were able to simulate the flow of the complex fluids and to optimize the design of the extraction equipment. This allowed them to predict the performance of the equipment and to optimize its design.

For more information about the Hartree Centre, please visit www.stfc.ac.uk/hartree.

Our community are involved in many of the new European initiatives:

- EGI Engage (H2020)
- VLData (H2020)
- Zephyr (H2020)
- HEP Software Foundation
- EU-T0 Initiative
- ...and more.

Summary

The UK has a long history as a major, and reliable, partner in WLCG supporting all four LHC VOs and over 30 additional groups.

In addition to resources, the UK provides critical services used by the worldwide community and leadership in many areas.

Funding is established until March 2016 but the GridPP5 proposal must be resubmitted by March to cover the remainder of Run-2.

Flat-cash funding is extremely challenging, with the volume and complexity of data increasing against a backdrop of technical evolution away from simple architectures and the need to prepare for beyond Run-2.

Important efforts are underway to reduce the barrier-to-entry for Grids and to integrate Grid resources with other infrastructures.

The UK community is contributing to many pan-European and Global initiatives.

- Backups

ZEPHYR approach

- Reports on requirements for 2020+ projects exist (HL-LHC, SKA, CTA, Euclid, etc.)
- Organize work using a loose “architecture”
 - API (what do I call to access my data)
 - Control Plane or Storage Virtualization (mediates between APIs and physical data centers)
 - Local Data Center (how resources plug in)
- Transversal items
 - Data Preservation
 - New network features
 - Security and confidentiality

DIRAC (Distributed Infrastructure with Remote Agent Control) INTERWARE is a software framework for distributed computing providing a complete solution to one (or more) **user community** requiring access to **distributed resources**. DIRAC builds a layer between the users and the resources offering a common **interface** to a number of heterogeneous providers, **integrating** them in a seamless manner, providing **interoperability**, at the same time as an optimized, transparent and reliable usage of the resources.

The Workload Management System with Pilot Jobs introduced by the DIRAC project is now widely used in various grid infrastructures. This concept allows to aggregate in a single system computing resources of different source & nature, such as computational grids, clouds or clusters, transparently for the end users.

Delivery

| VO | T1 Pledged (Delivered) | T2 Pledged (Delivered) |
|-------|------------------------|------------------------|
| ALICE | 2% (4.1%) | 2% (4.7%) |
| ATLAS | 10% (10.7%) | 12.5% (16.1%) |
| CMS | 8% (8.5%) | 5% (7.6%) |
| LHCb | 19% (16.7%) | 31% (37.7%) |

Alice - opportunistic use

ATLAS - T1 >100% efficiency and T2 leverage

CMS - Threshold T1 and T2 leverage

LHCb - UK led the way in prototyping Tier2ds which moved T1 workflows to T2s
