4th International Conference on New Frontiers in Physics
Kolymbari, 23rd-30th August, 2015

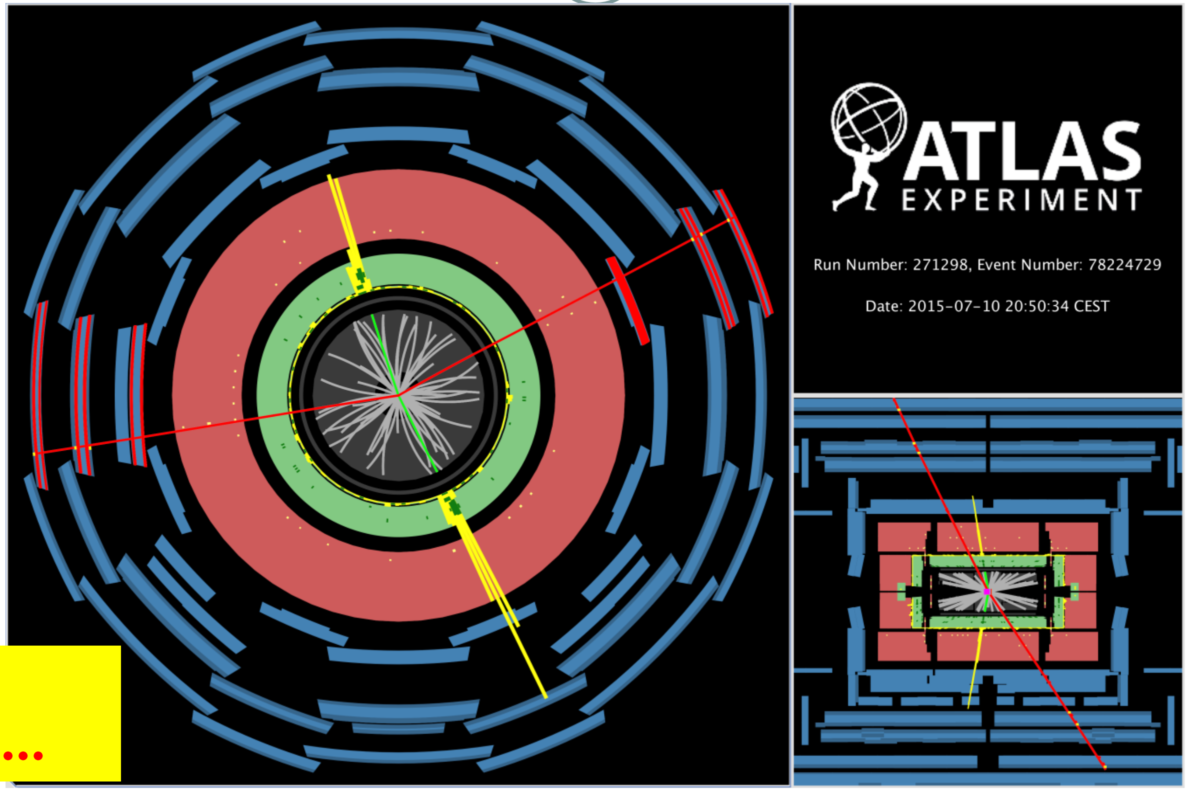
Recent Results from the ATLAS Experiment

Farès Djama (CPPM Marseille)
On behalf of the ATLAS Collaboration

Outlook

- 0) ATLAS and Run 1 Data
- I) Higgs Boson Physics
- II) Top physics
- III) Search for Supersymmetry
- IV) Electroweak measurements
- V) QCD measurement
- VI) 2015: Early preliminary results

0) ATLAS and Run 1 Data



But this is a Run 2 event…

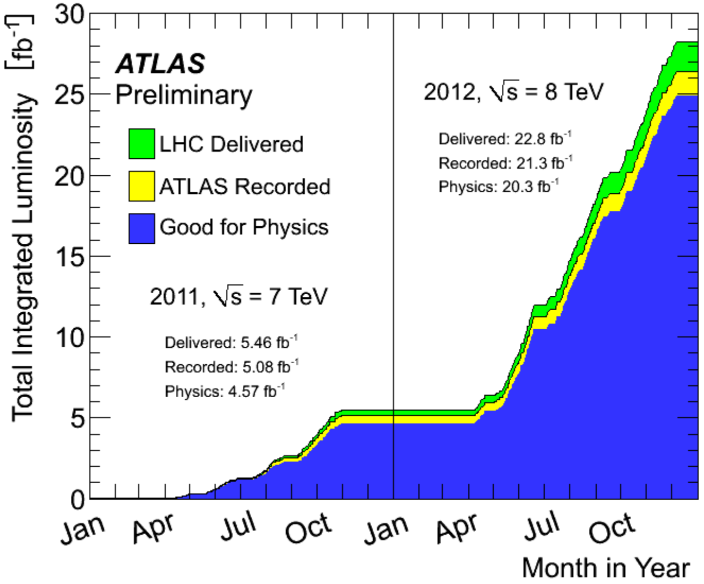
The ATLAS Detector in Run 1

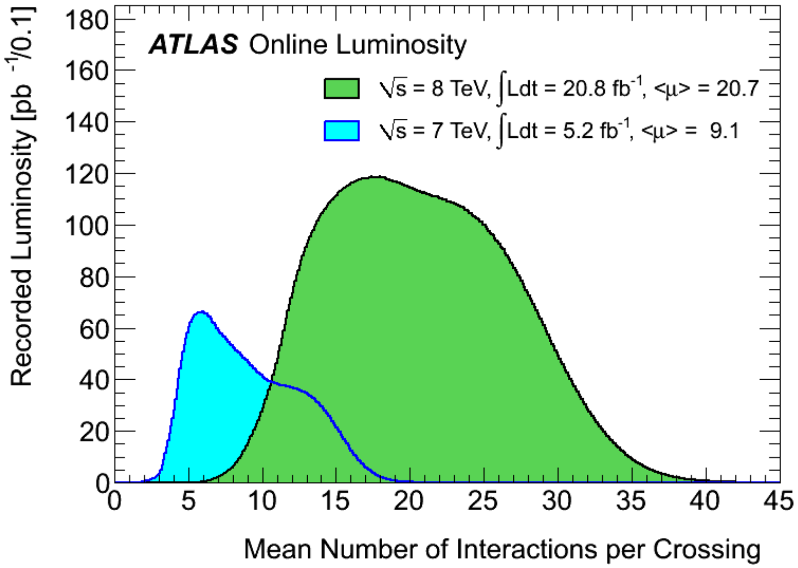
- ATLAS experiment designed as a multipurpose detector, able to precisely reconstruct all kind of "objects" and measure their kinematics.
- These "objects" are electrons, muons, taus, photons, hadronic jets, heavy flavour, isolated hadrons and missing transverse energy.
- ATLAS trigger system uses a large variety of objects with thresholds as low as possible and a DAQ system able to record events up to a rate of 1 kHz.

- During Run 1, ATLAS could optimally exploit the wonderful potential offered by the LHC.
- The Higgs-Englert-Brout boson discovered.
- More than 450 publications on a large variety of particle physics measurements and searches.

- **This talk: recent results of Run 1 and early preliminary results from Run 2.**
- **It will be of course a selection. Sorry if your favourite channel or analysis is not shown.**

Data Taken in Run 1





- A total of 24.9 fb^{-1} recorded in good conditions at p-p center of mass energies of 7 and 8 TeV.
- With an overal efficiency of 93.5 %.

I) Higgs Boson Physics

- Since the Higgs boson discovery, efforts are put to test the Higgs hypothesis of the new particle.
  - This means measurement of its spin, couplings, and width.
  - Looking for not yet observed decays.
  - Looking for rare production and decay modes.
  - Lot of efforts put to improve the precision of the Higgs mass.

See plenary talk by X. Chen

Higgs Boson Mass

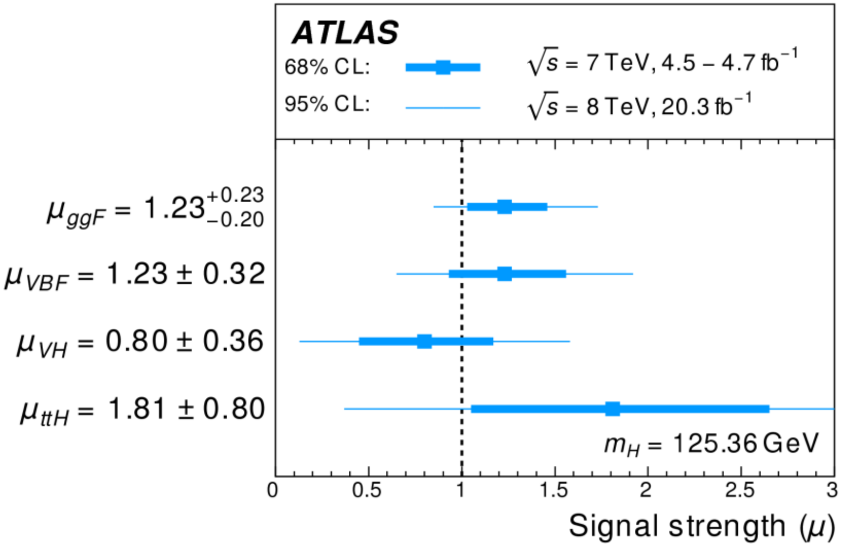
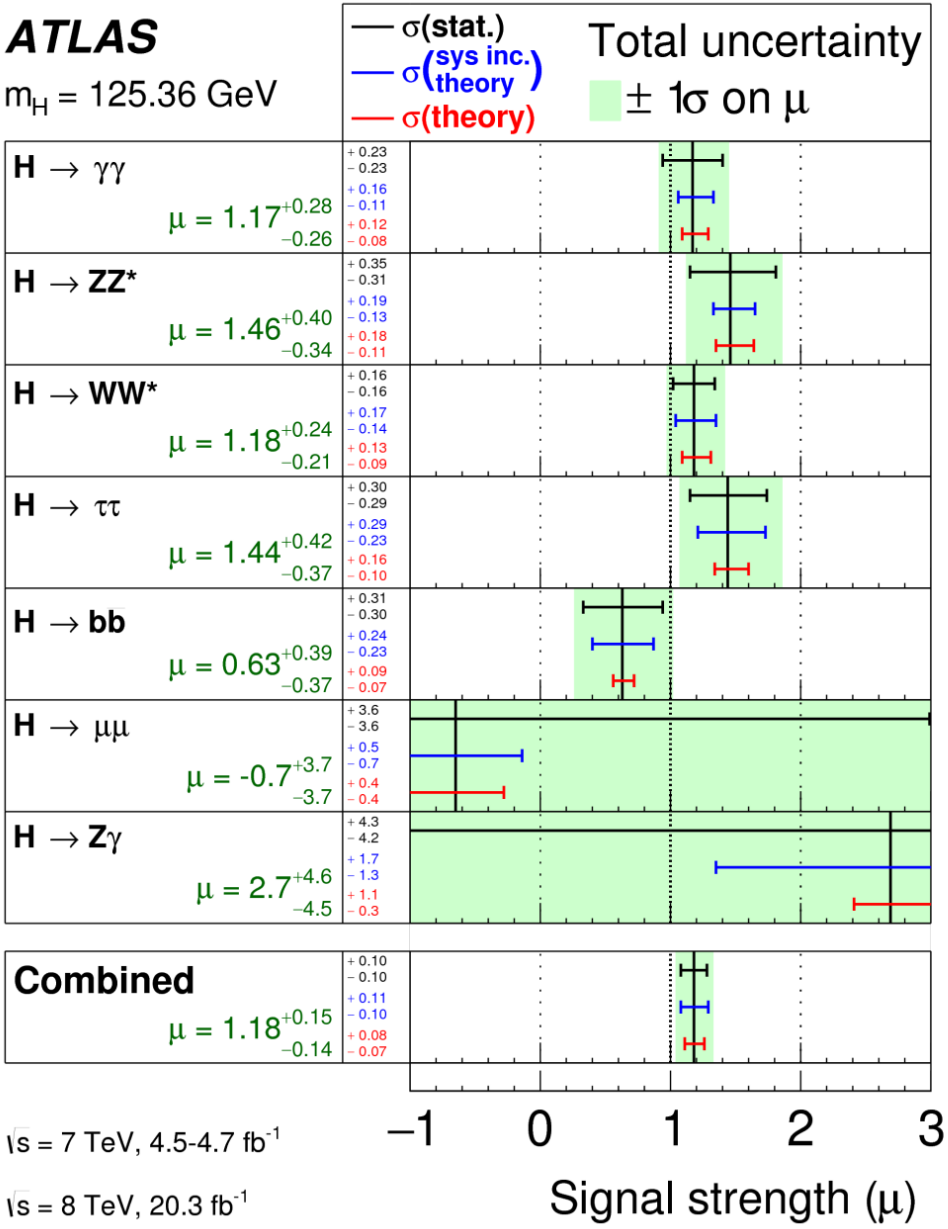
Signal Strength for Production and Decay Modes

arXiv.1507.04548

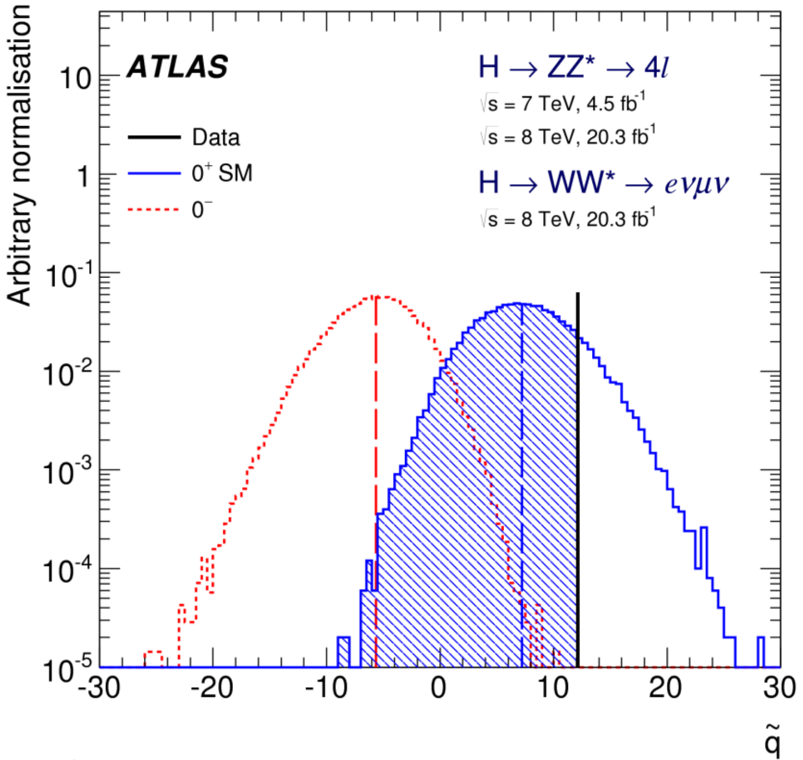


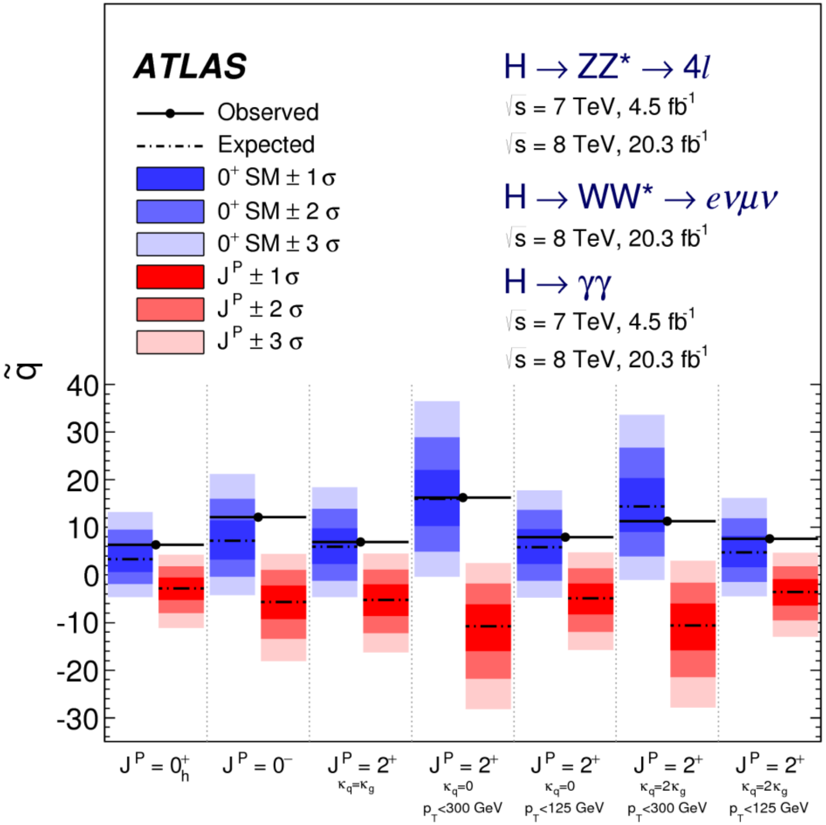


Spin and Parity Tests

See talk by M. Queitsch-Maitland

- All studies support the 0^+ hypothesis.
- Other hypothesis ruled out at 99.9 % CL





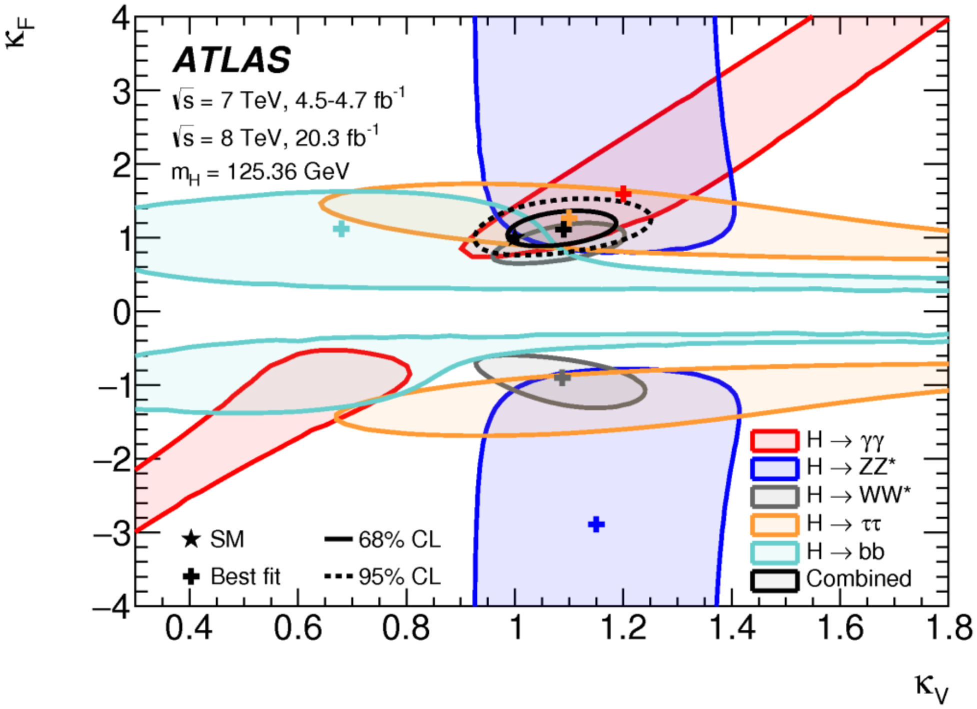
arXiv.1506.05669

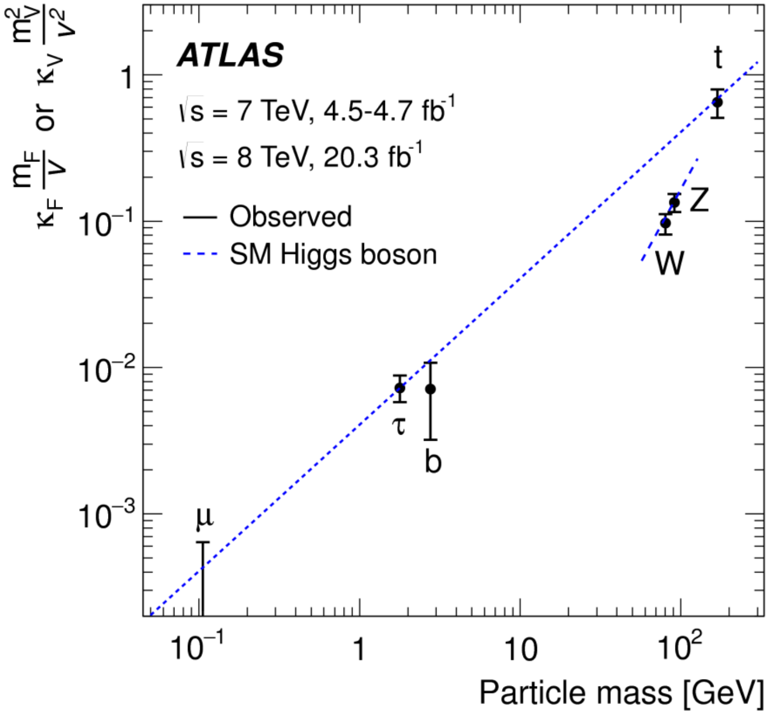
Measurements of Higgs Couplings

See talk by N. Lu

- Fits in the so called κ framework.
- Shown here: Global coupling fits assuming universal couplings for fermions (κ_F) and bosons (κ_V).
- No BSM signal so far (under a few assumptions).

arXiv.1507.04548

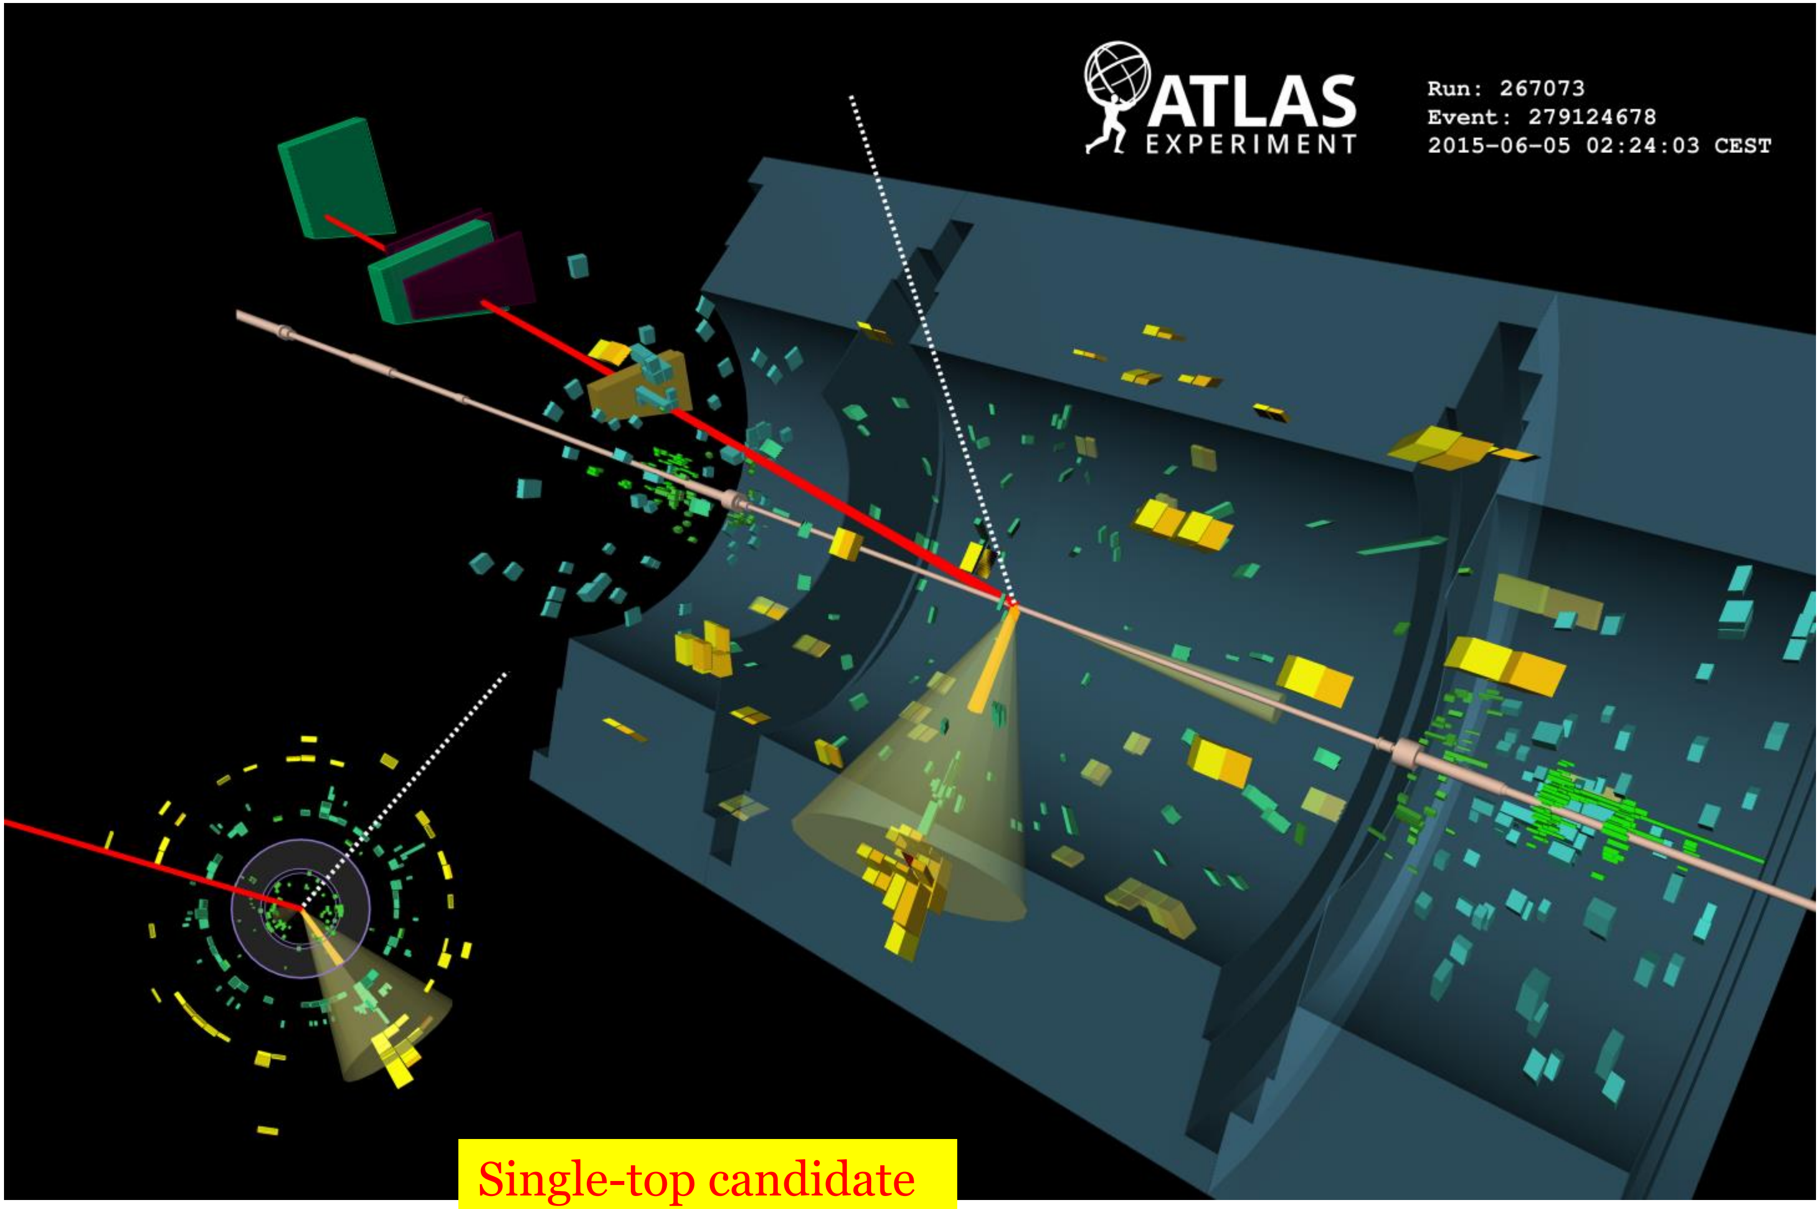




II) Top Physics

- Heaviest known particle: Specific role in electroweak symmetry breaking ?
- Top quark decays before hadronization: Top properties measurement.
- LHC: a copious source of top quarks: More than 5 M t-t̄ pairs produced during Run 1.

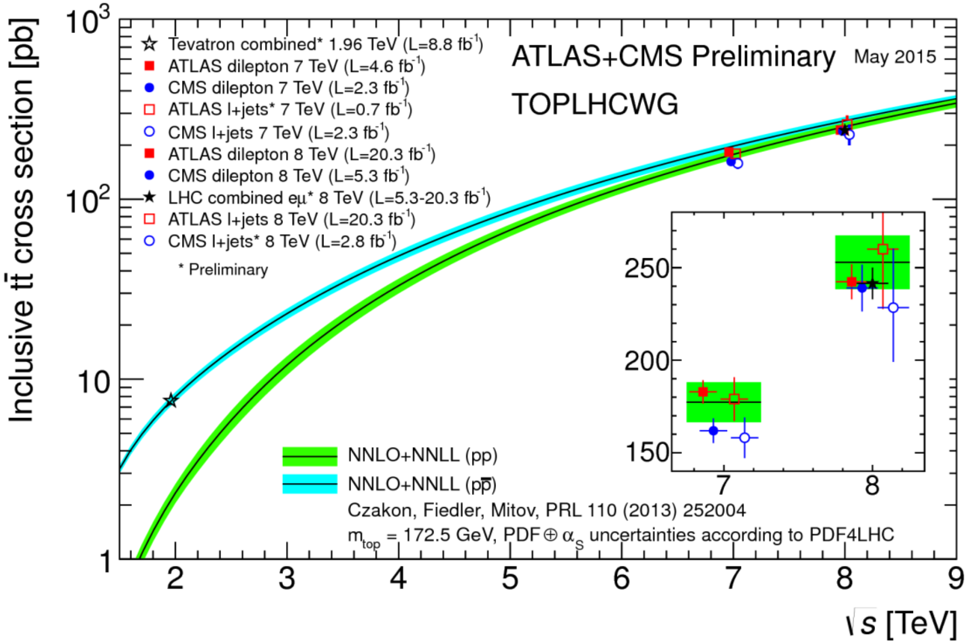
See plenary talk by A. Onofre



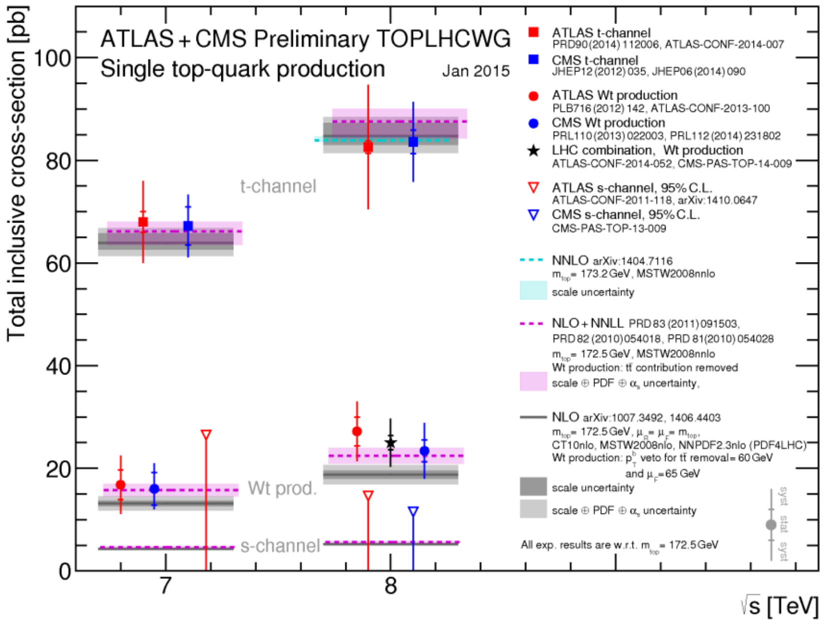
Single-top candidate from 2015

Cross Section Measurement

See talk by C. Bertsche



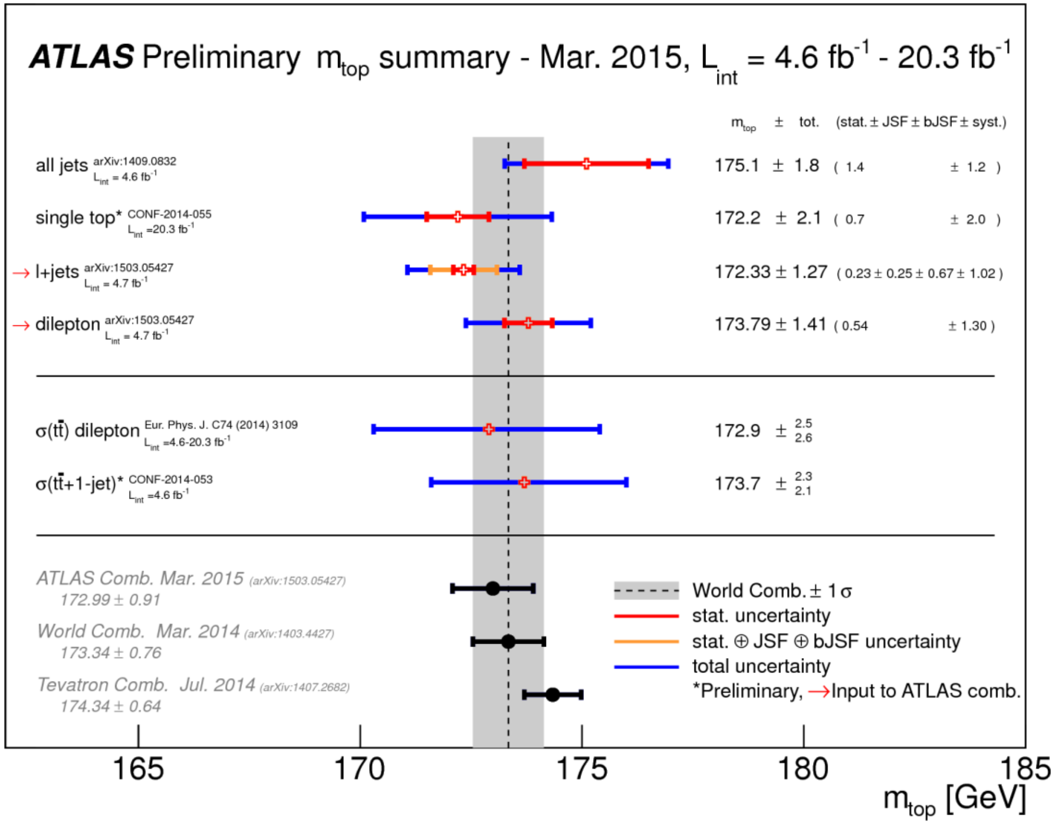
See talk by A. Chegwidden



Measured cross section of t-$\bar{t}$ pairs and single-top production at $\sqrt{s}$ = 7 and 8 TeV

Measurement of Top Mass

See talk by G. Barone

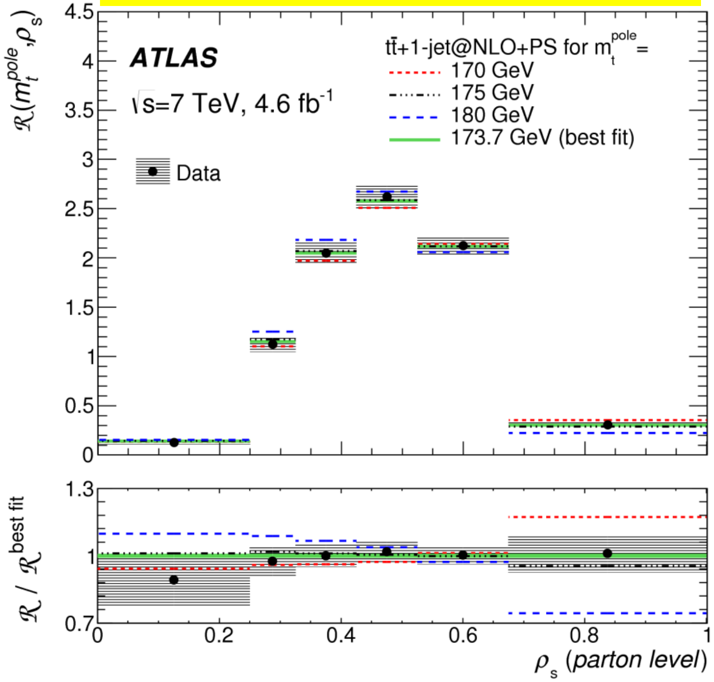


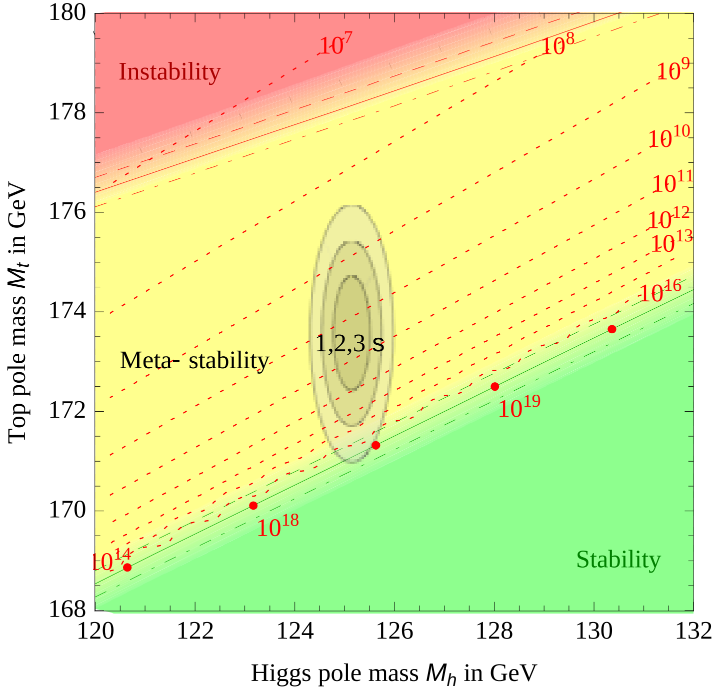
- Top quark mass: Already the best known quark mass.
- ATLAS measurement from different channels are consistent.
- And consistent with world and Tevatron combinations.

More on Top Mass

$$M_{top}^{pole} = 173.7 \pm^{2.1}_{2.3}\ GeV$$

arXiv.1507.01769





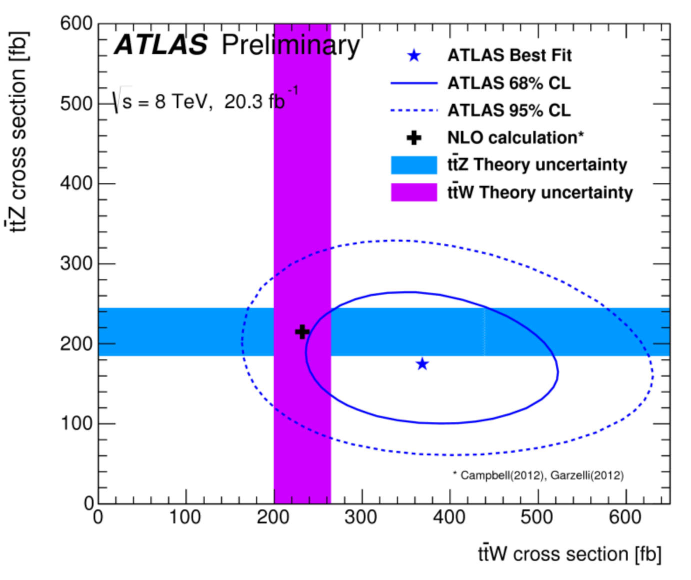
arXiv.1307.3536

- Mass measurement techniques are calibrated to the mass in MC, which is not clearly related to a theoretically well defined mass.
- Exploit the dependence of gluon radiation on the top mass to extract the “pole” top mass from $t\bar{t}$ +1 jet events.

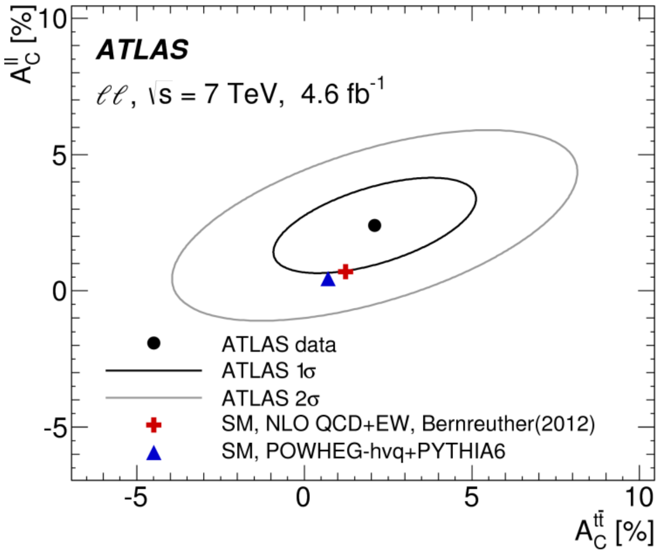
- The measured top mass does not favor the stability of the vacuum up to the Planck scale.
- A new Symmetry needed around $10^{10} - 10^{12}$ GeV ?

Top Physics: A Tool to assess SM and look for signals BSM

ATLAS-CONF-2015-032



JHEP05(2015)061



- A significance of 5 and 4.2 σ over the background only hypothesis for ttW and ttZ respectively.
- Tests of top couplings.
- Well within NLO QCD predictions.

- Charge asymmetry: Induced from NLO corrections to $q\bar{q}$ and qg initiated production.
- Measurement based on $t\bar{t}$ pair production and leptonic days of the W.
- Results in agreement with SM prediction: top quark is preferentially emitted in the direction of the quark.

See talk by F. Fassi for searches for BSM signals

III) Search for SuperSymmetry

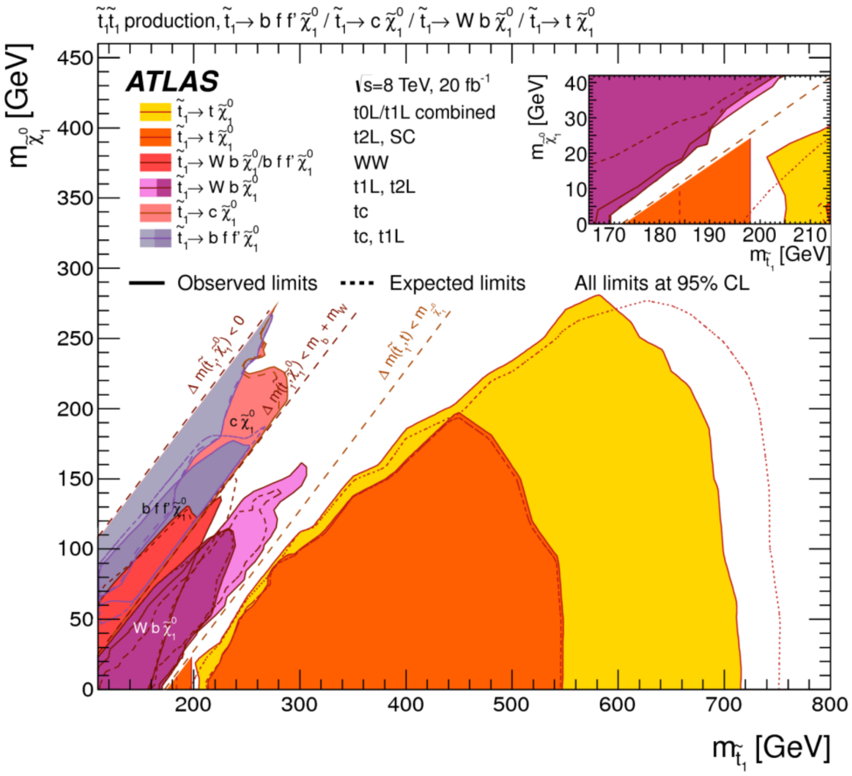
- Most popular BSM theory.
- Large number of searches, using all the variety of objects reconstructed by ATLAS.
- Large number of parameters: Searches interpreted within specific SUSY versions: pMSSM, mSUGRA, GMSB…

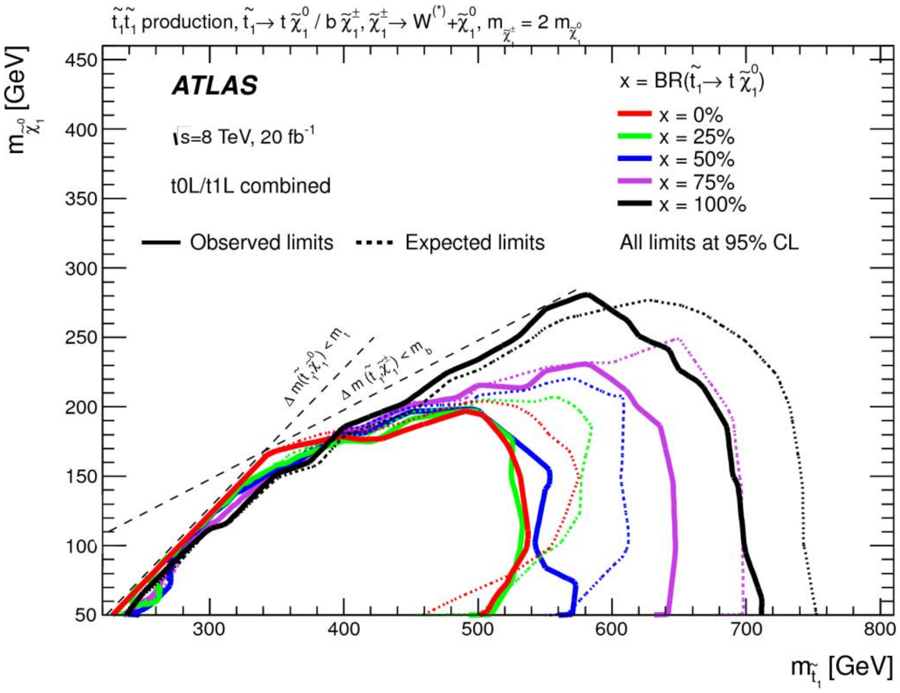
See plenary talk by E. S. Kuwertz

Third Generation Squarks in Run 1

- Third generation squarks required to be light (~ 1 TeV) to protect the Higgs mass.
- Several scenarii have been investigated.
- Below: Summary of ATLAS Run 1 searches for stop pairs if only LSP is involved in stop decay (left) and if only LSP and the first chargino are involved (right), assuming that the chargino mass is two times the LSP one.

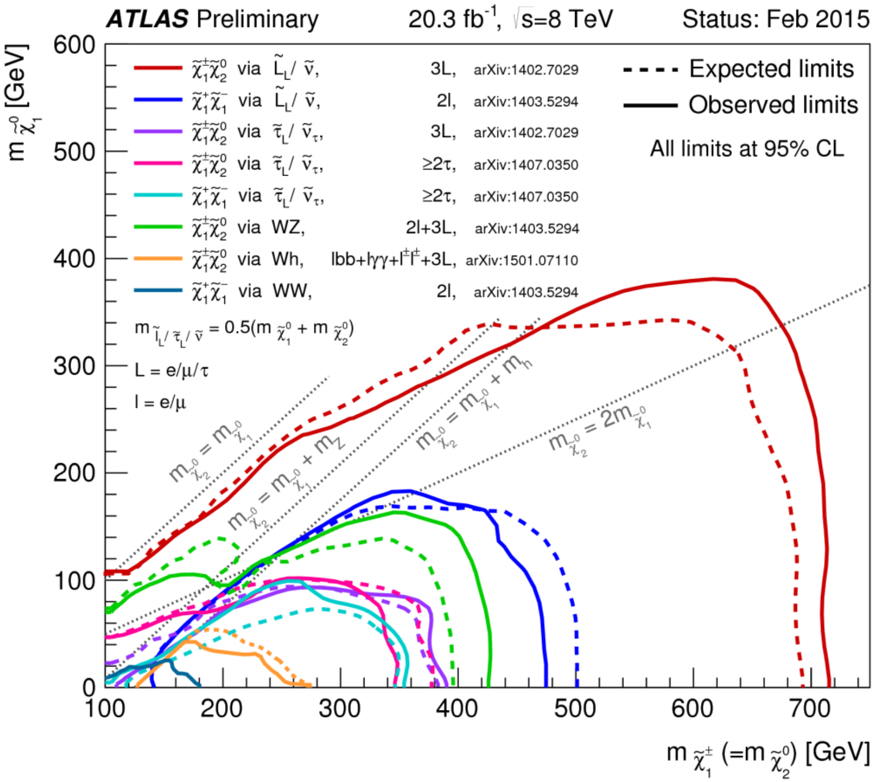
See talk by J. Kenneth Anders

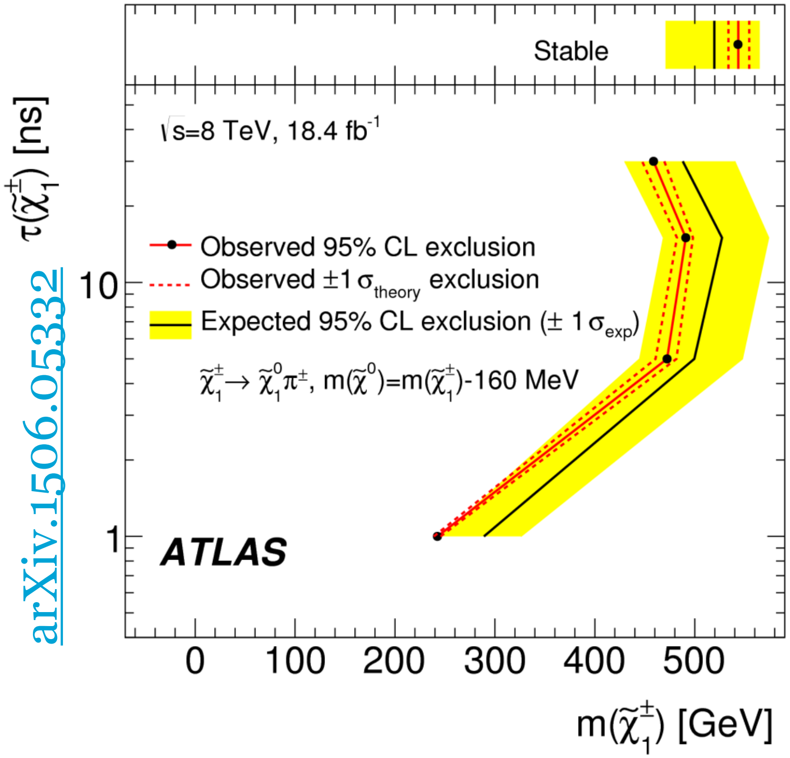




arXiv.1506.08616

See talk by H. Ren





arXiv.1506.05332

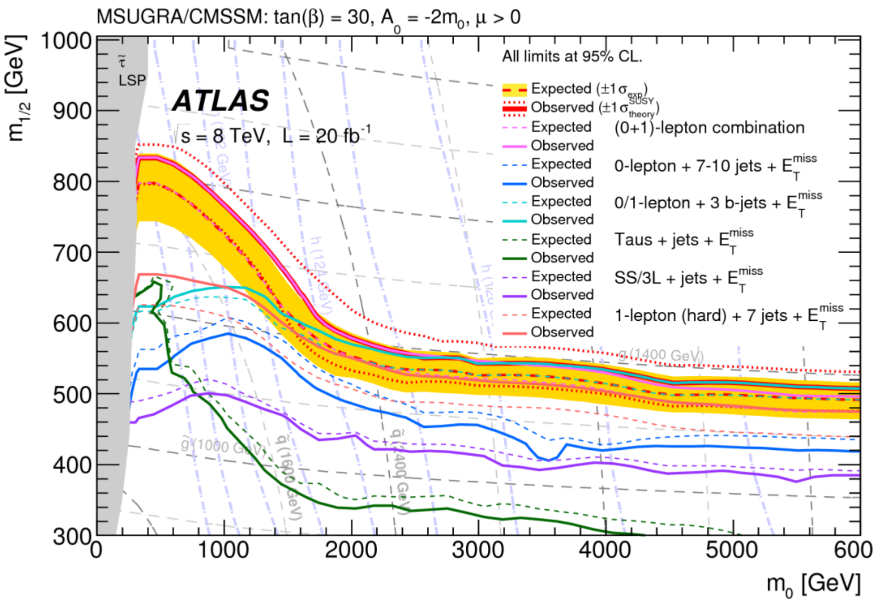
Summary of ATLAS Searches of EWK production of charginos and neutralinos, using several decay modes (100 % branching ratio is assumed for each mode).

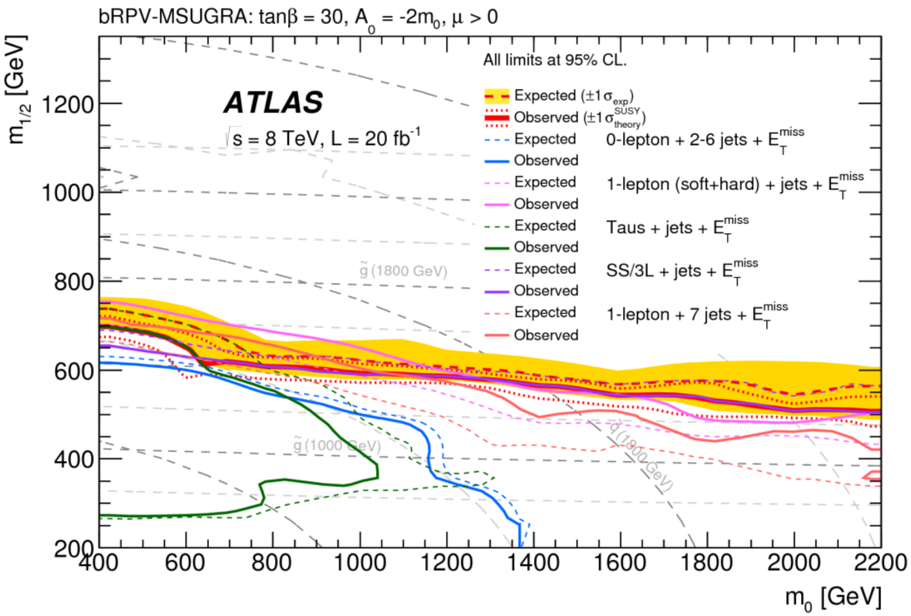
Excluded range of lifetime as a function of chargino mass for charginos, using the ionisation rate measured by the Pixel Detector: Ionisation rate of a heavy (non relativistic) charged particle is high and depends on its mass.

Interpretation of Search Limits

arXiv.1507.05525

- Combining statistically independent channels (both in signal and control regions) to constrain SUSY models.
- Several SUSY models have been studied.
- Shown below: mSUGRA with conserved (left) and violated (right) R-parity, with fixed $\tan\beta = 30$, $A_0 = -2\,m_0$, and $\mu > 0$.





ATLAS SUSY Searches* - 95% CL Lower Limits

No evidence so far…

*Only a selection of the available mass limits on new states or phenomena is shown. All limits quoted are observed minus 1σ theoretical signal cross section uncertainty.

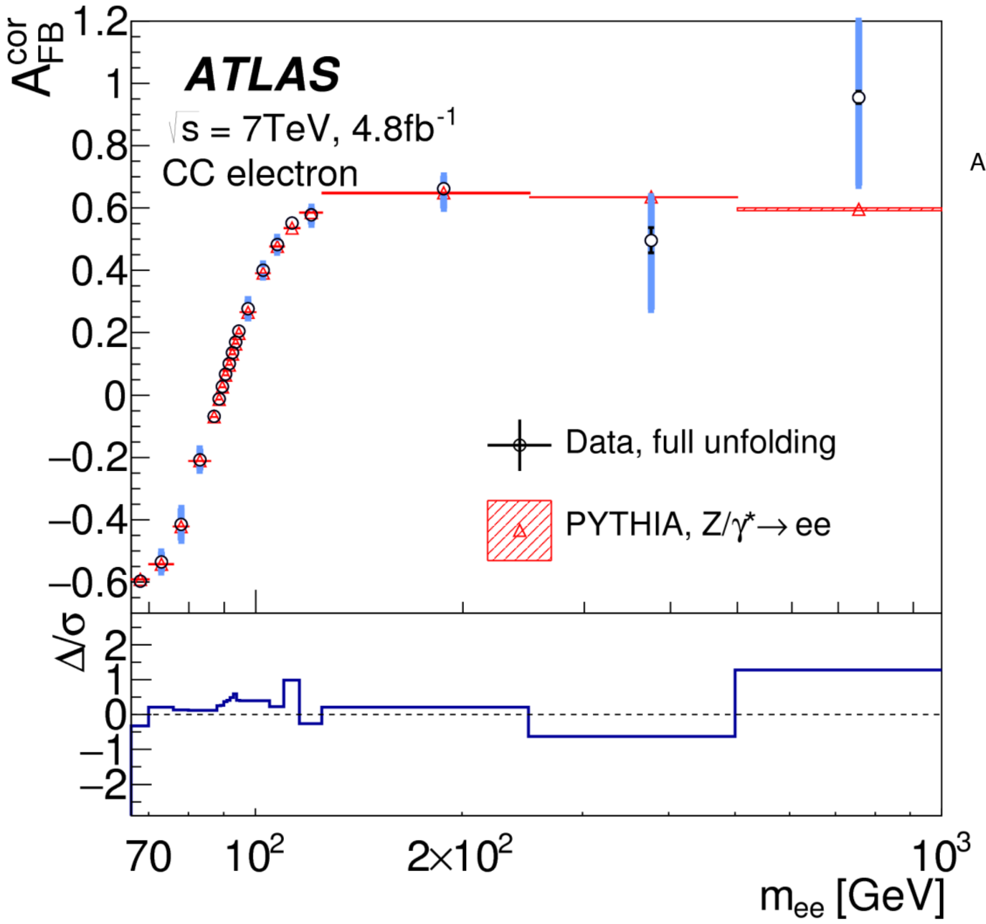
IV) Electroweak Measurements

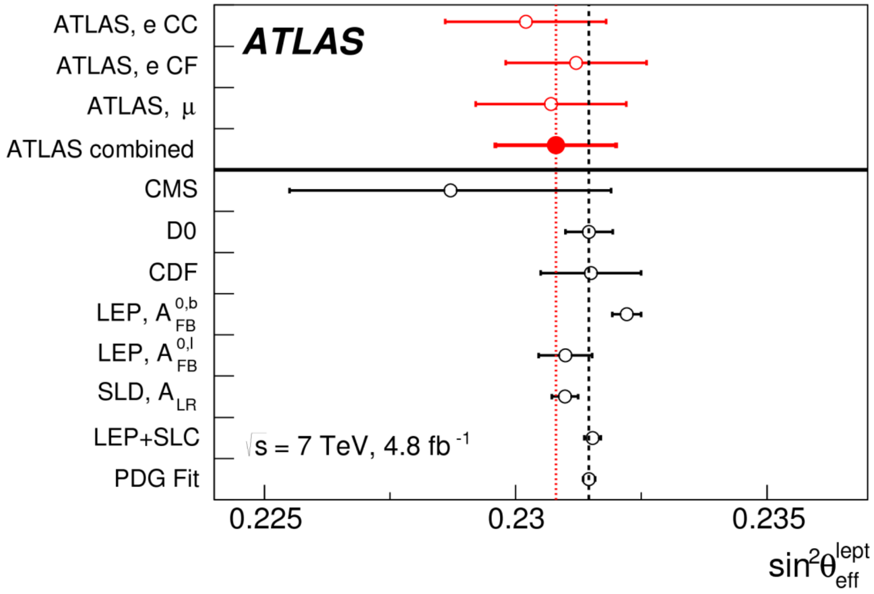
- LHC is a copious source of electroweak gauge bosons and their interactions (VBF, VBS).
- EW measurements are one of the tools to look beyond SM.
- Some EW process are background to searches (VV).

See plenary talk by W. Buttinger

Lepton Forward-Backward Asymmetry

See talk by N. Calace





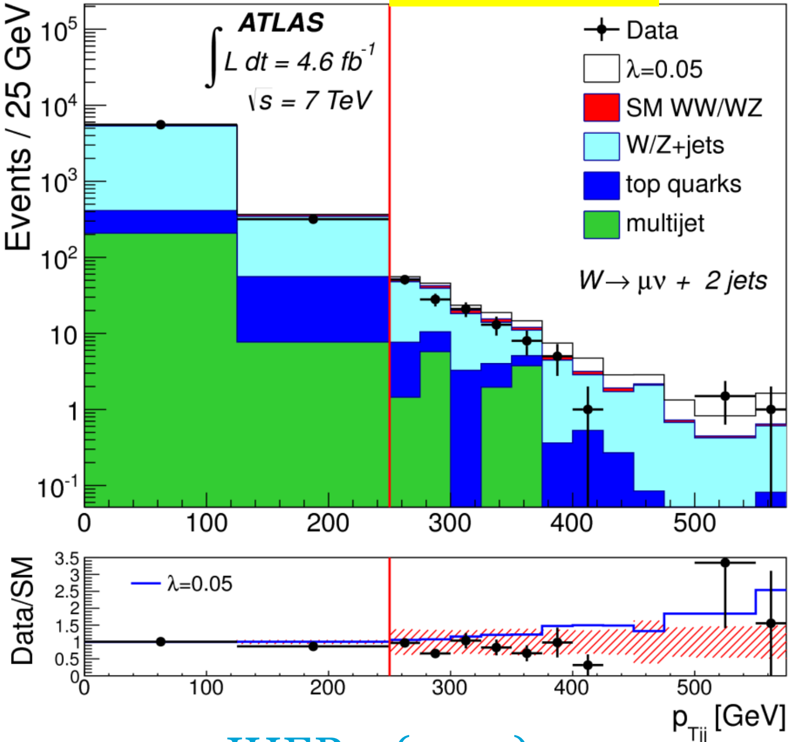
Measurement "à la LEP" and extraction of an effective Weinberg angle.

arXiv.1503.03709

Multi Bosons Production

- Multi boson production: Sensitive to new physics through TGC and QGC.
- Measurements interpreted as limits on anomalous (BSM) couplings.
- No BSM signal seen.

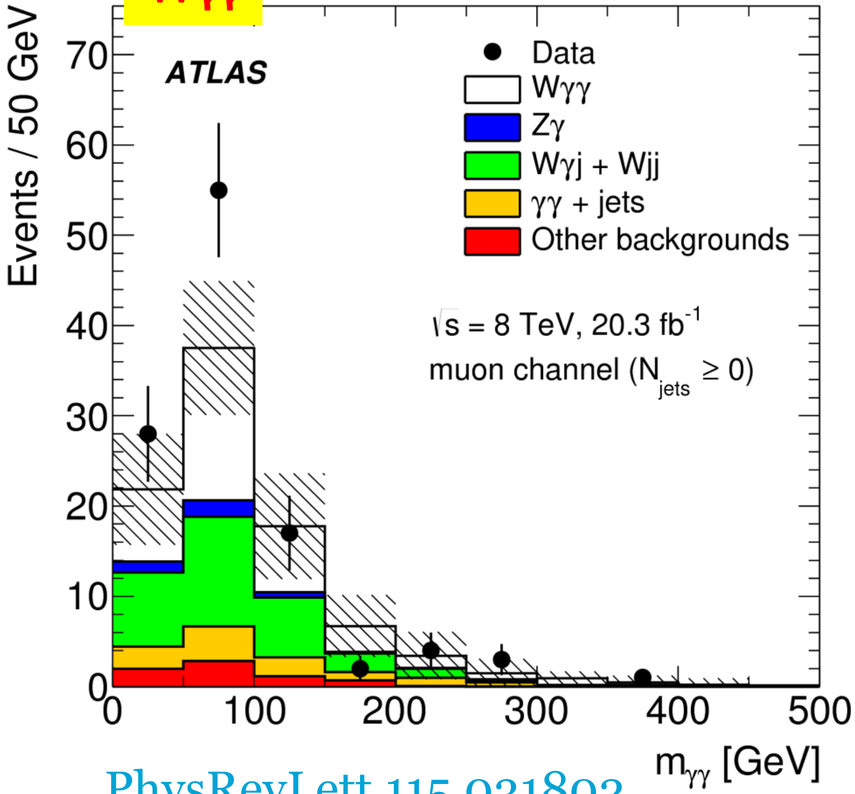
WW+WZ



JHEP01(2015)049

Wγγ

See talk by M. Becker



PhysRevLett.115.031802

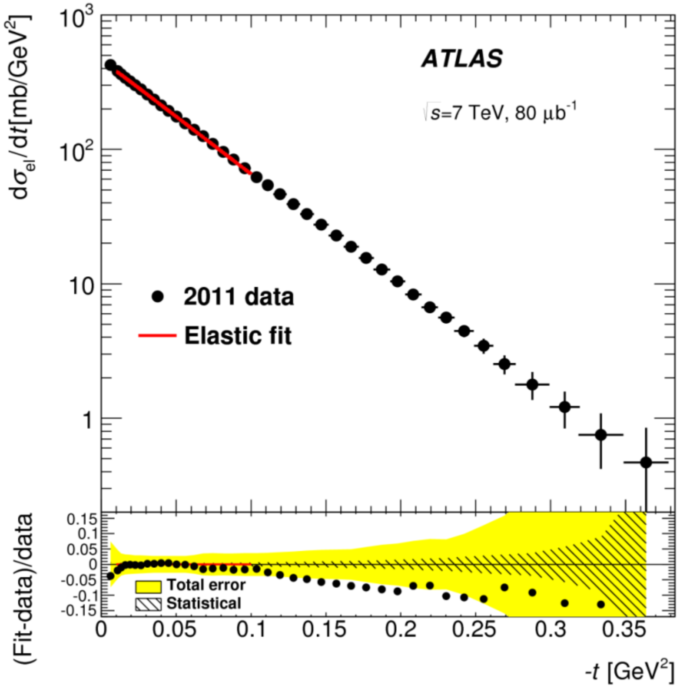
V) QCD Measurements

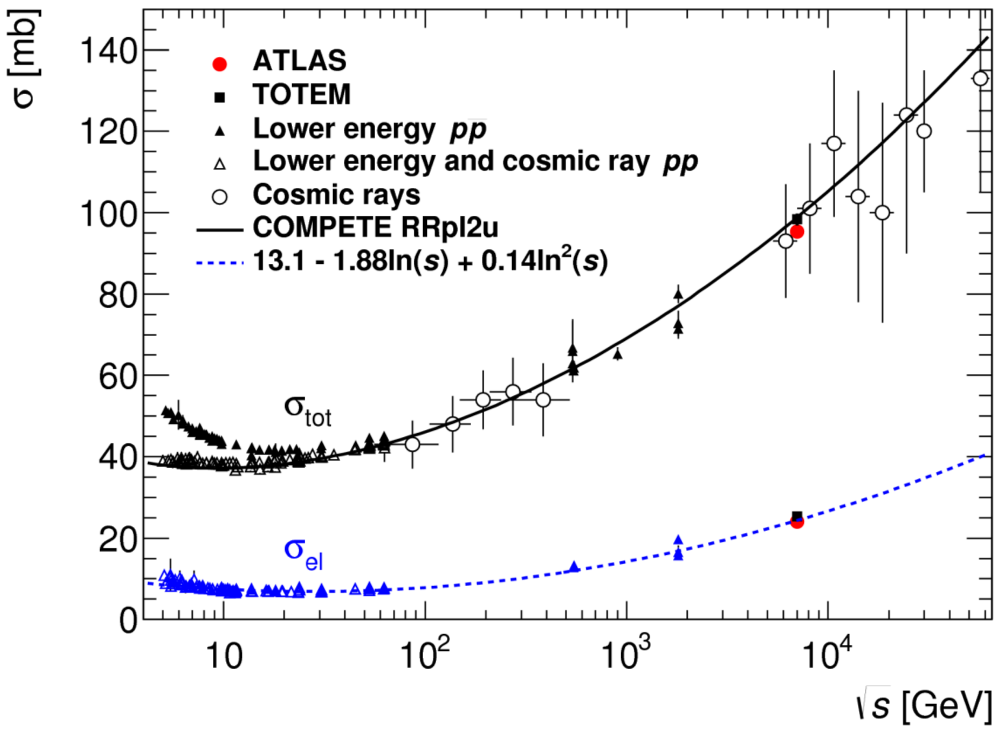
- QCD tested more and more in its perturbative calculations: Many measurements became sensitive to effects beyond NLO QCD.
- QCD understanding important for other measurements: PDF, underlying events.

See plenary talk by W. Buttinger

Determination of σ_{tot} with ALFA

- Proton-proton elastic differential cross section measured with ALFA stations (roman pots) is fitted and the ρ parameter is determined.
- Total cross section is computed from it using the optical theorem.



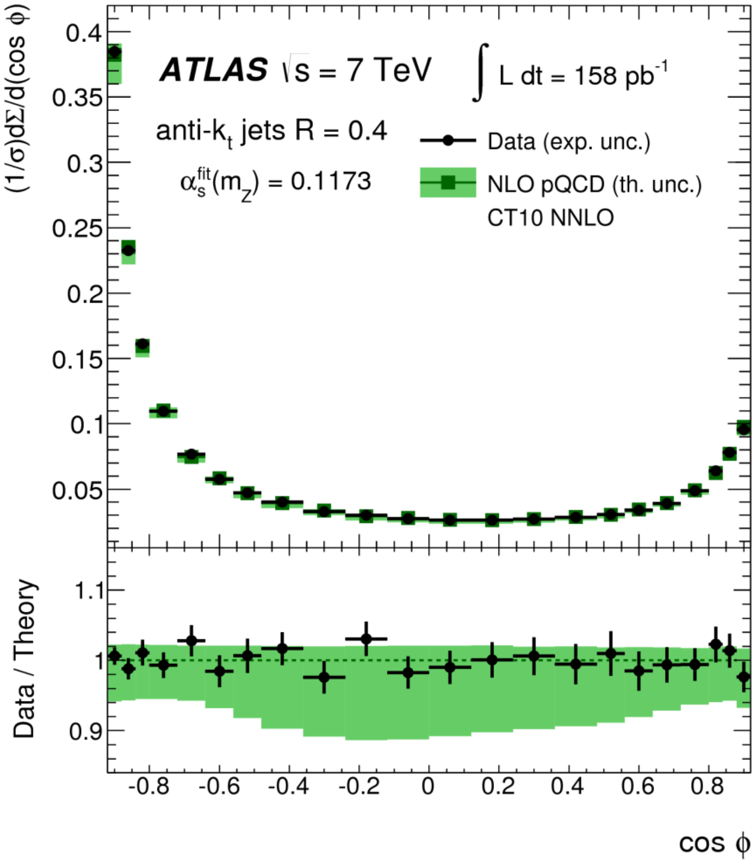


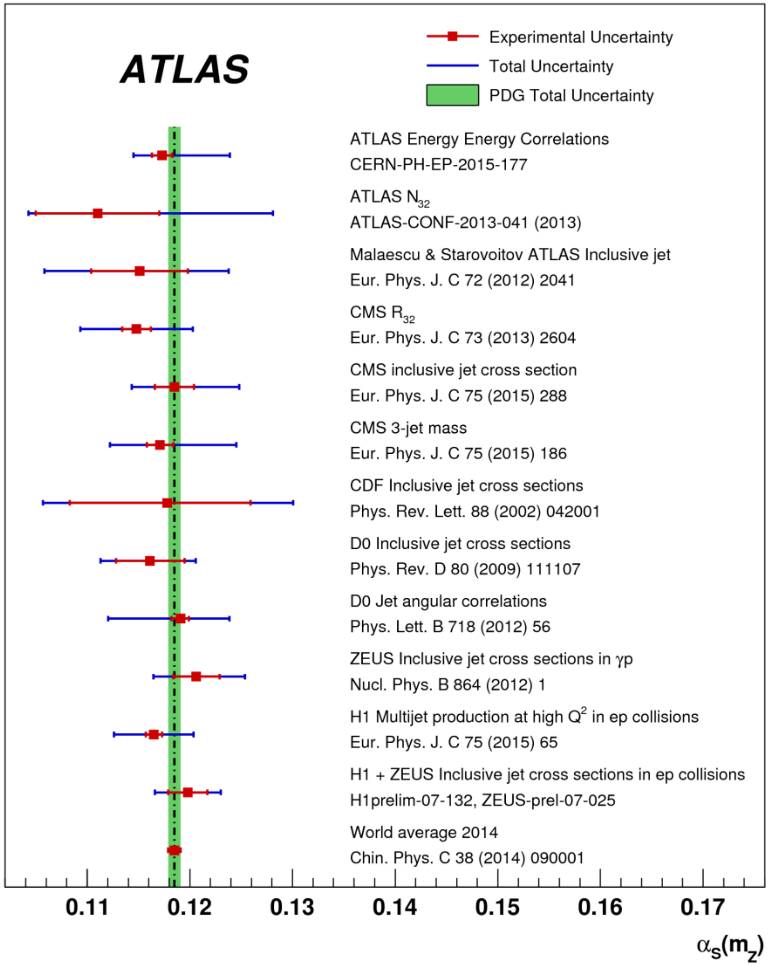
S0550321314003253

Transverse Energy-Energy Correlation

- Transverse energy-energy correlation for jets (left) and its fit with NLO QCD.
- Measured value of α_s compared to other measurements at hadron colliders.

[arXiv.1508.01579](https://arxiv.org/abs/1508.01579)



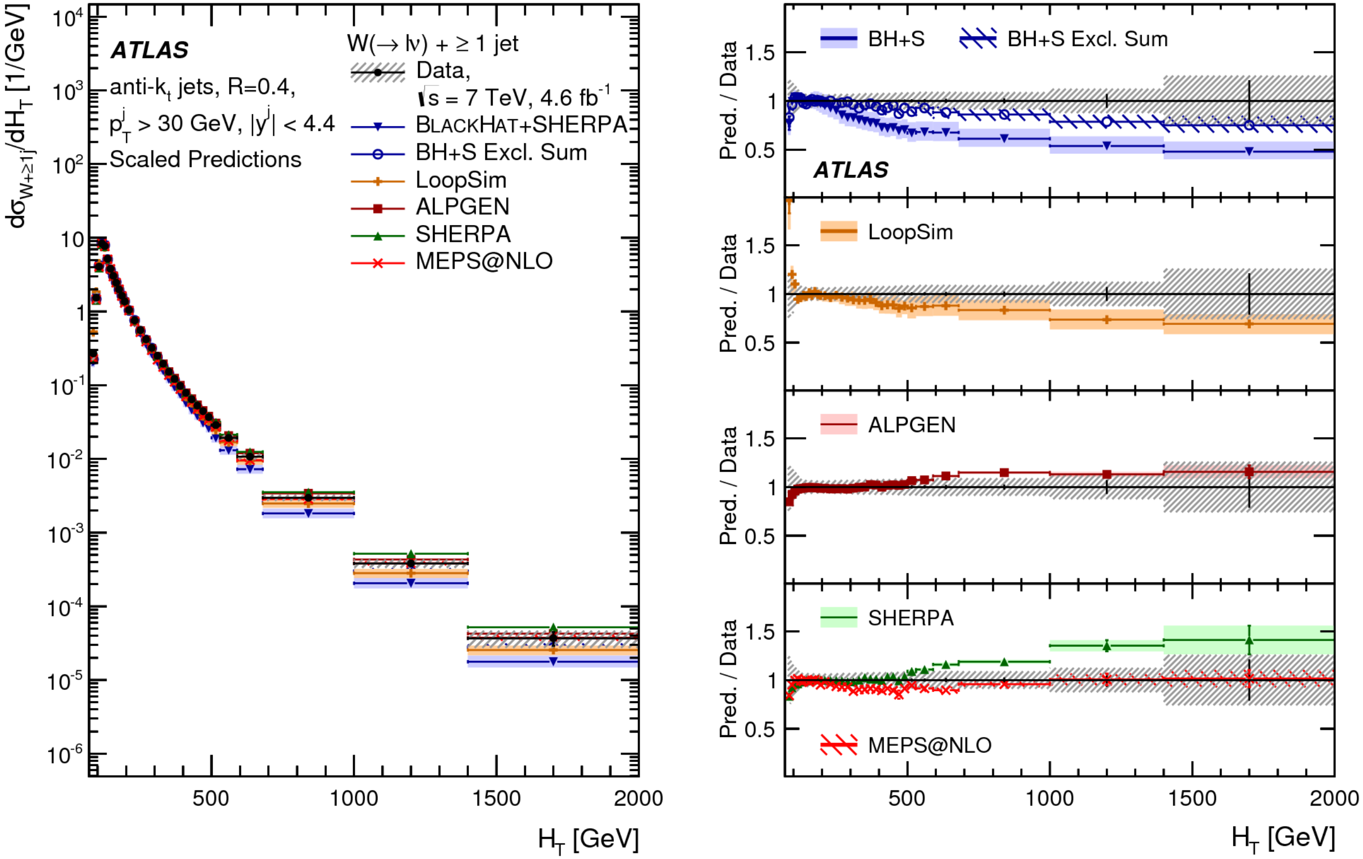


Jets Measurements

See talk by N. Calace

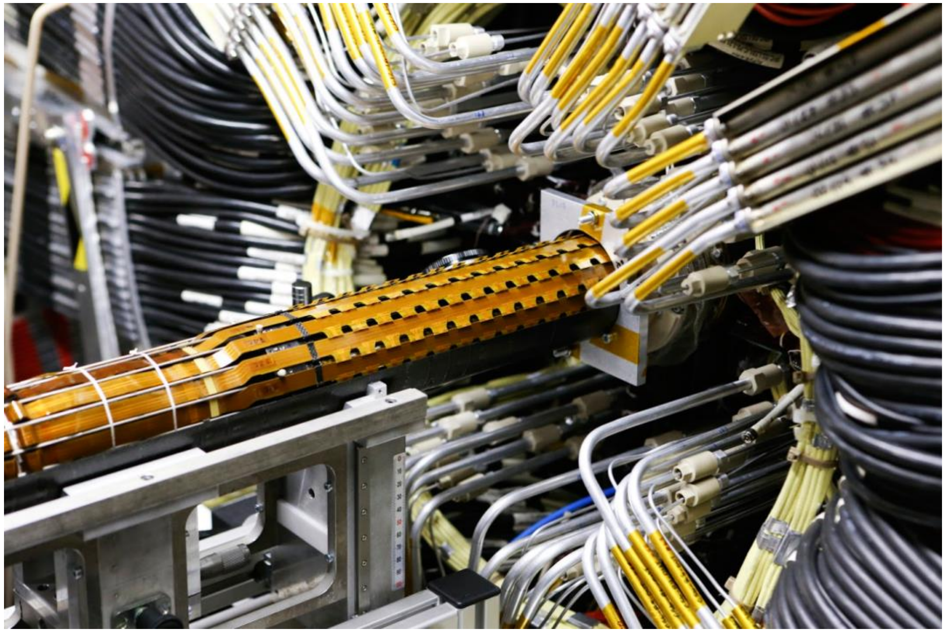
- Jets and V+jets cross sections: Test QCD beyond leading order.
- No theoretical prediction able to describe all differential cross sections. Example given here: scalar sum of lepton + jets P_t + E_T^{miss} in W+jets production:

EPJC/s10052-015-3262-7



VI) 2015: Early Preliminary Results

- LHC is delivering p-p collisions at 13 TeV.
- Main improvement in ATLAS: A fourth pixel layer, at 3.3 cm from the beam axis (the closesr layer was at 5.5 cm): The IBL.
- Many more improvements: Additional muon chambers, repairs, new analysis model, trigger upgrade…
- Next: early ATLAS results from Run 2



Insertion of the IBL into the center of ATLAS

Tracking with IBL

See talk by S. Miglioranzi

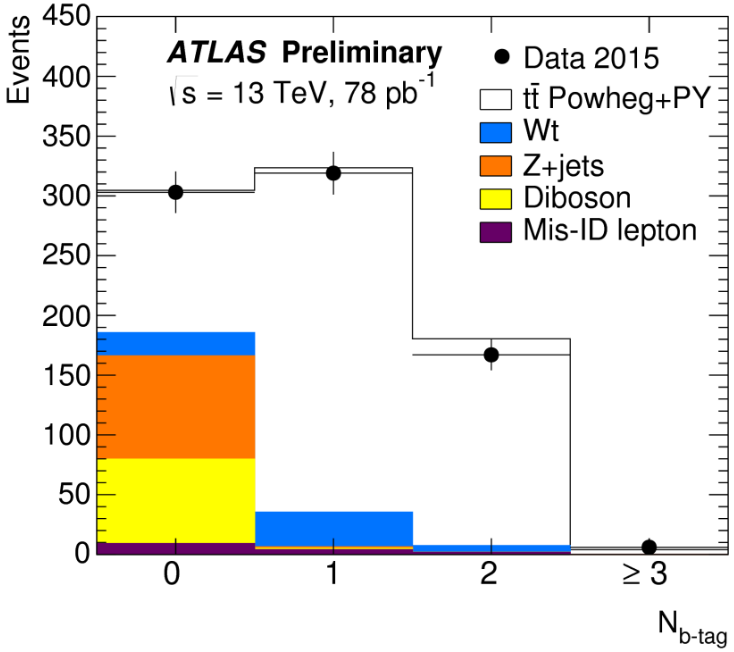
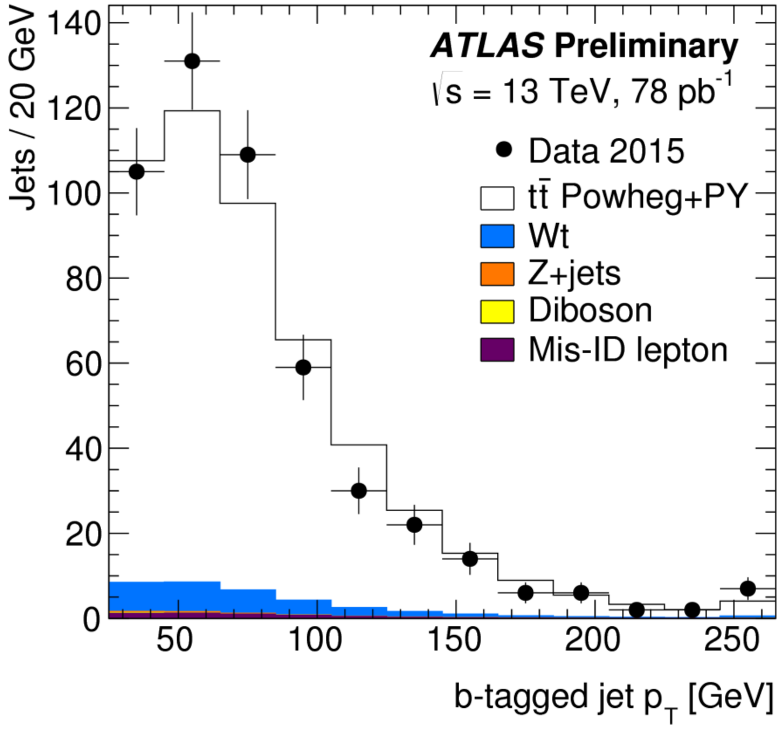
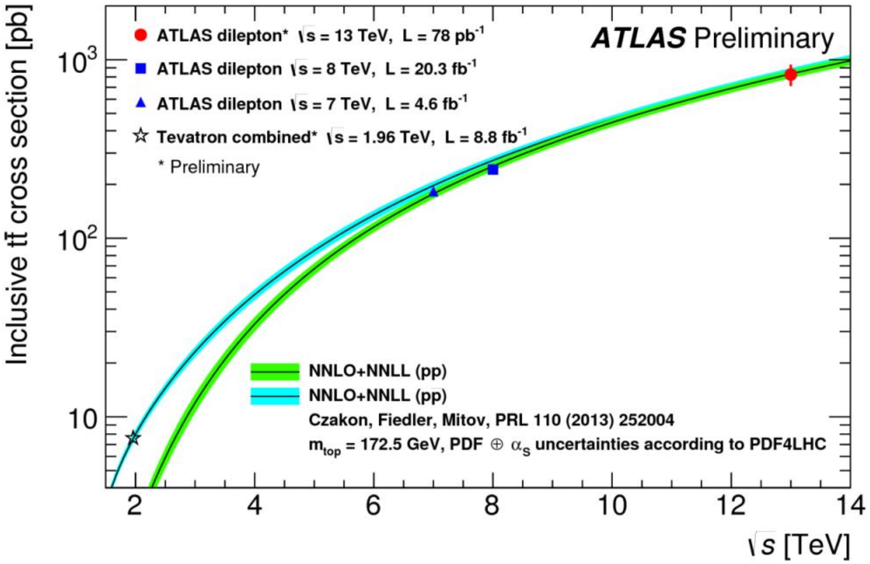
ATLAS-CONF-2015-038

Cross section of t-t̄ pairs production at 13 TeV

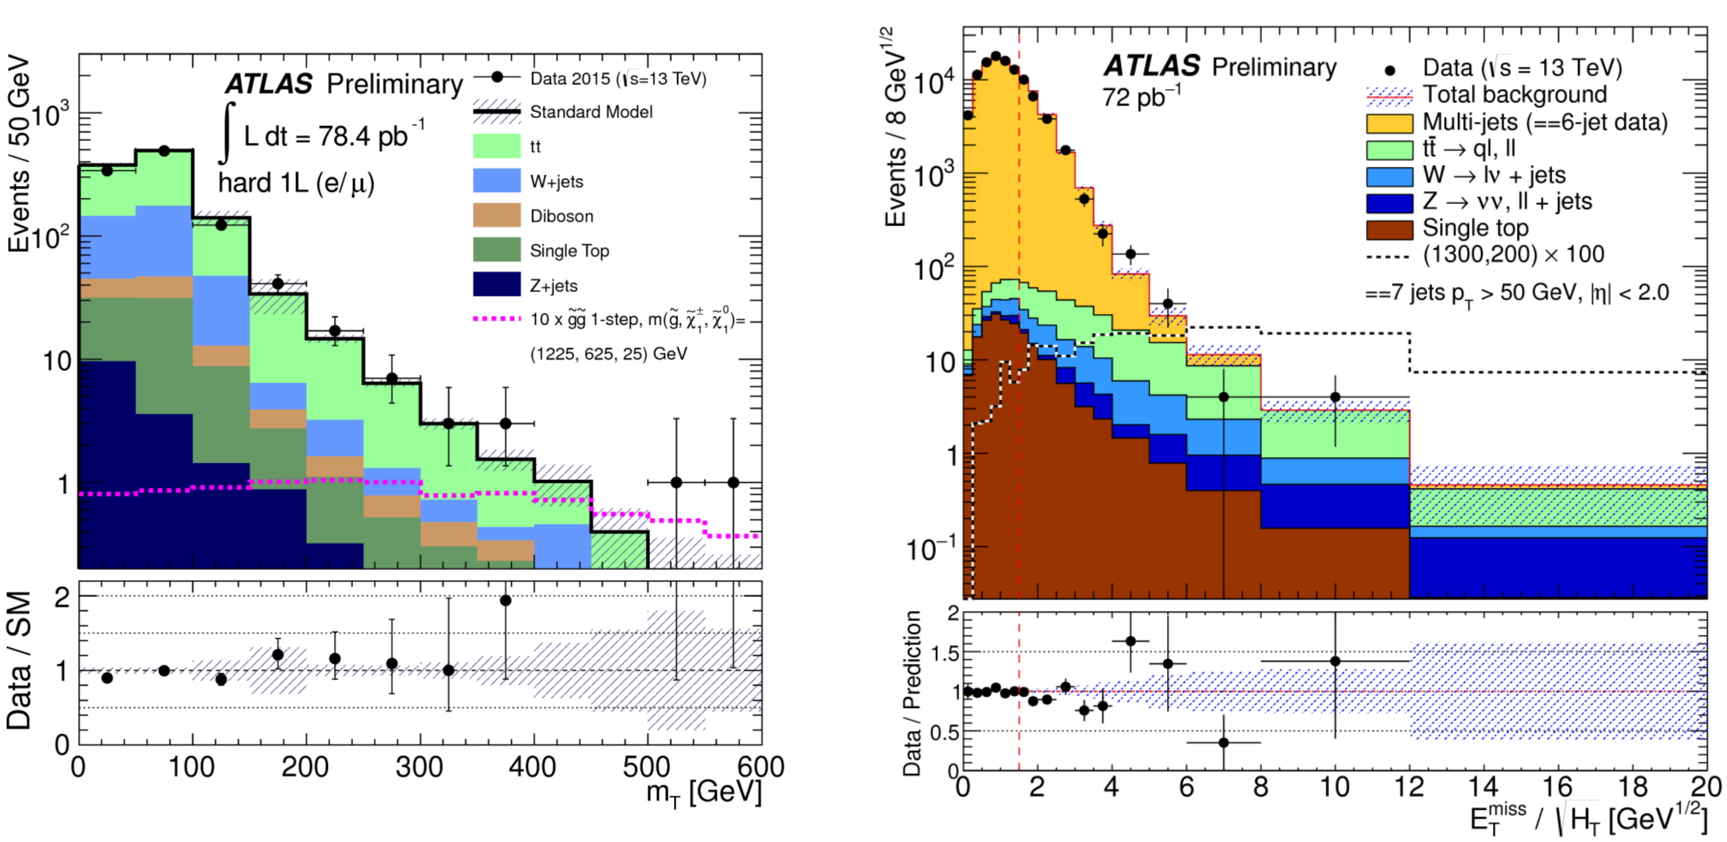
ATLAS-CONF-2015-033



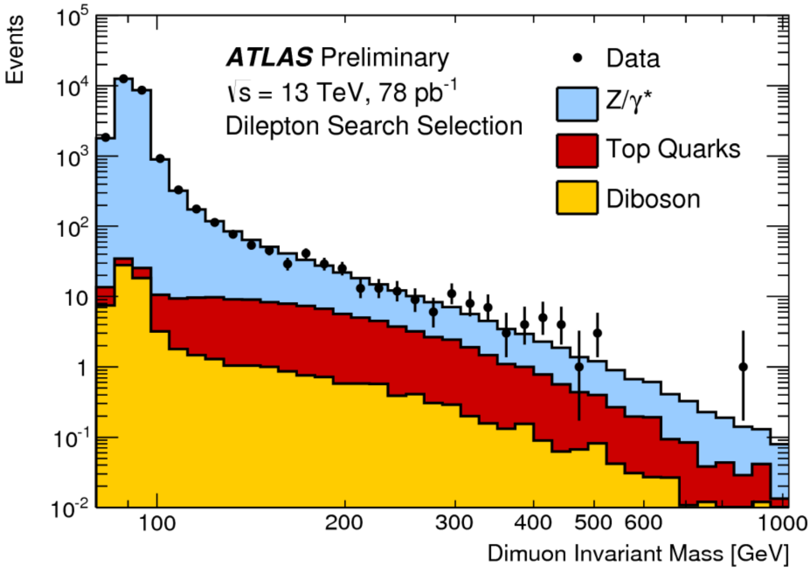


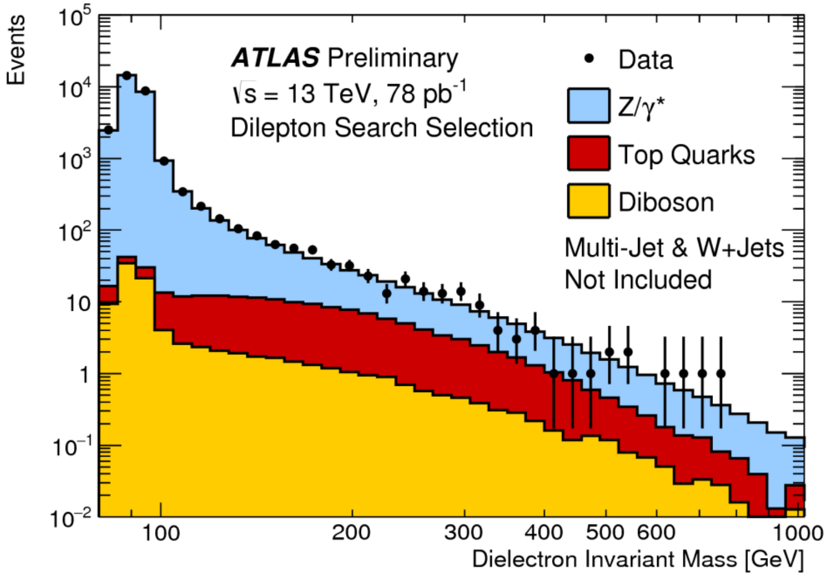


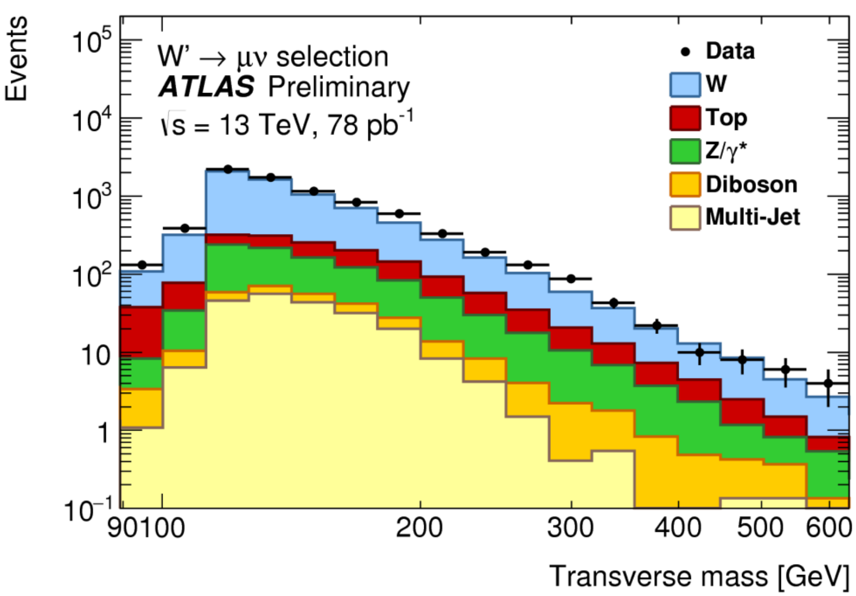
- Examples of “Loose Signal Regions” in SUSY searches at 13 TeV.
- Signals are magnified by factors of 10 and 100.
- Nice agreement between data and expected background.

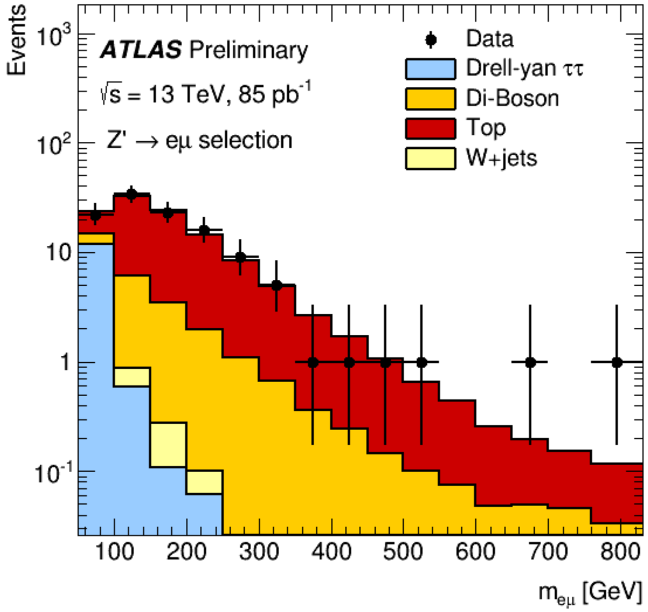


Start of search for extra bosons at 13 TeV

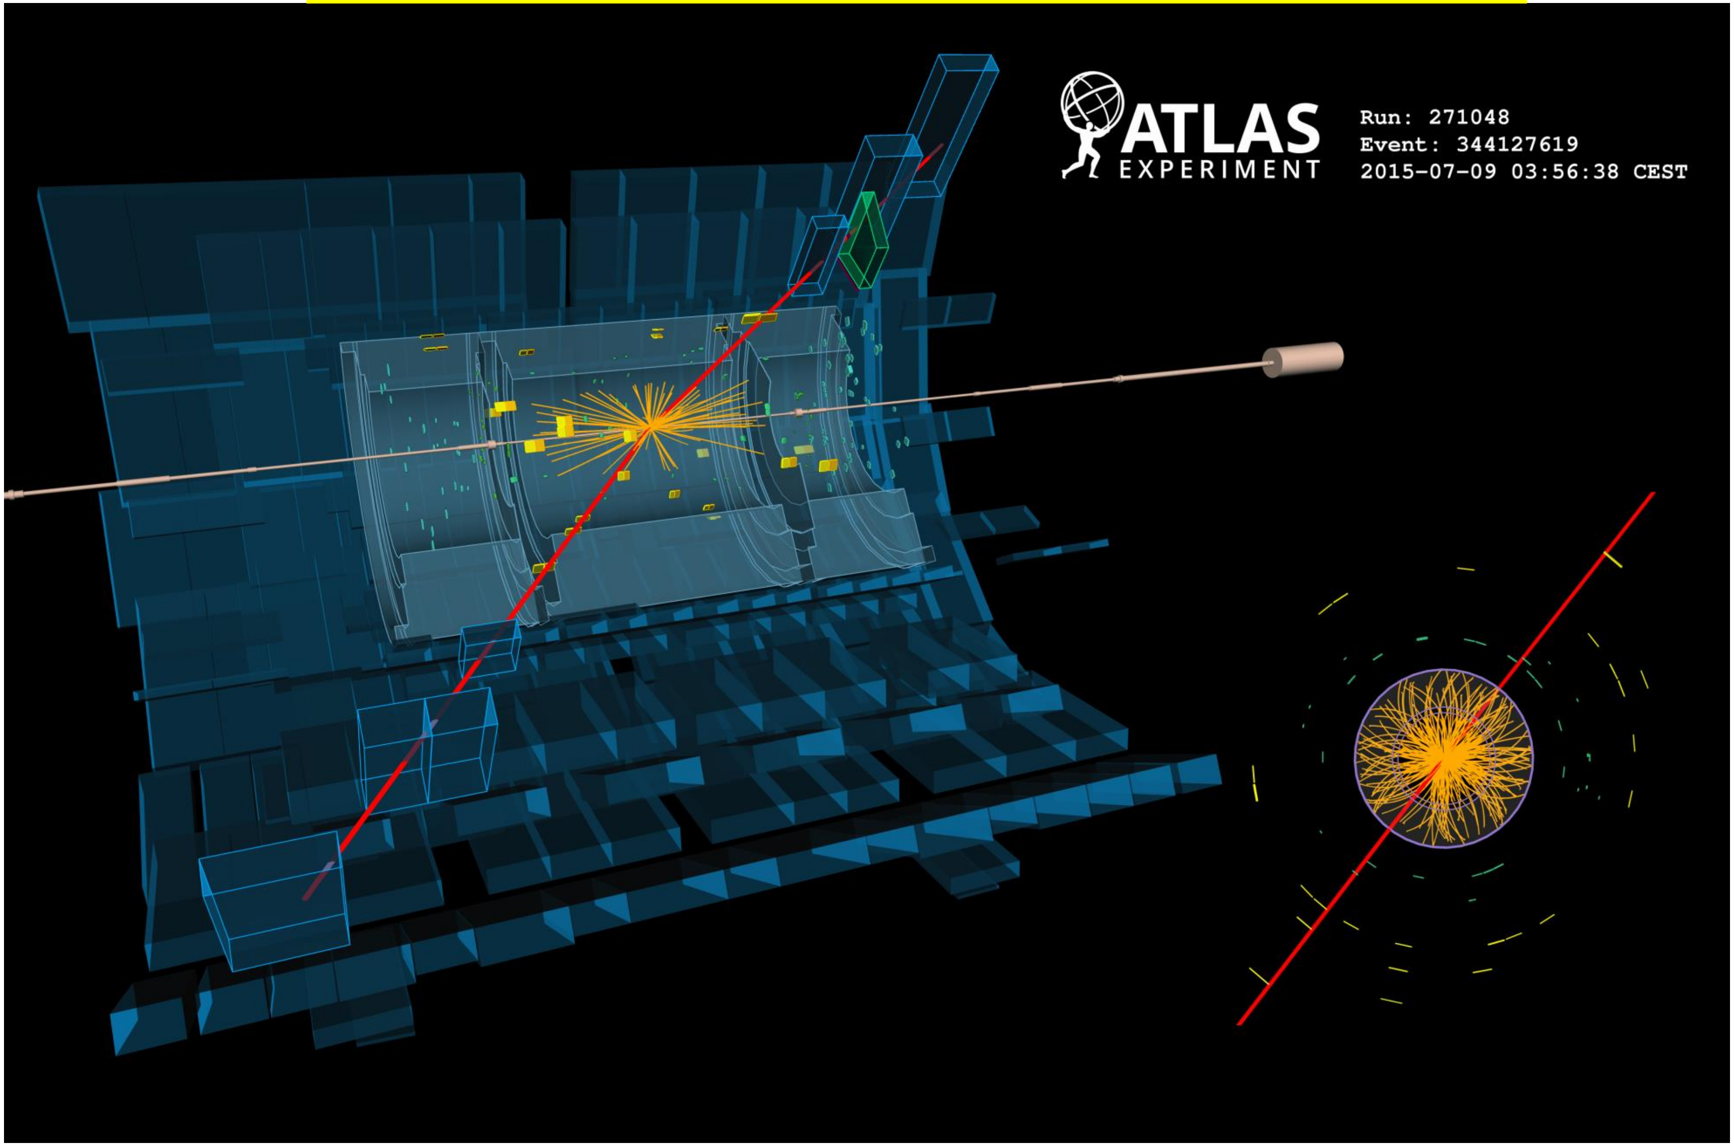








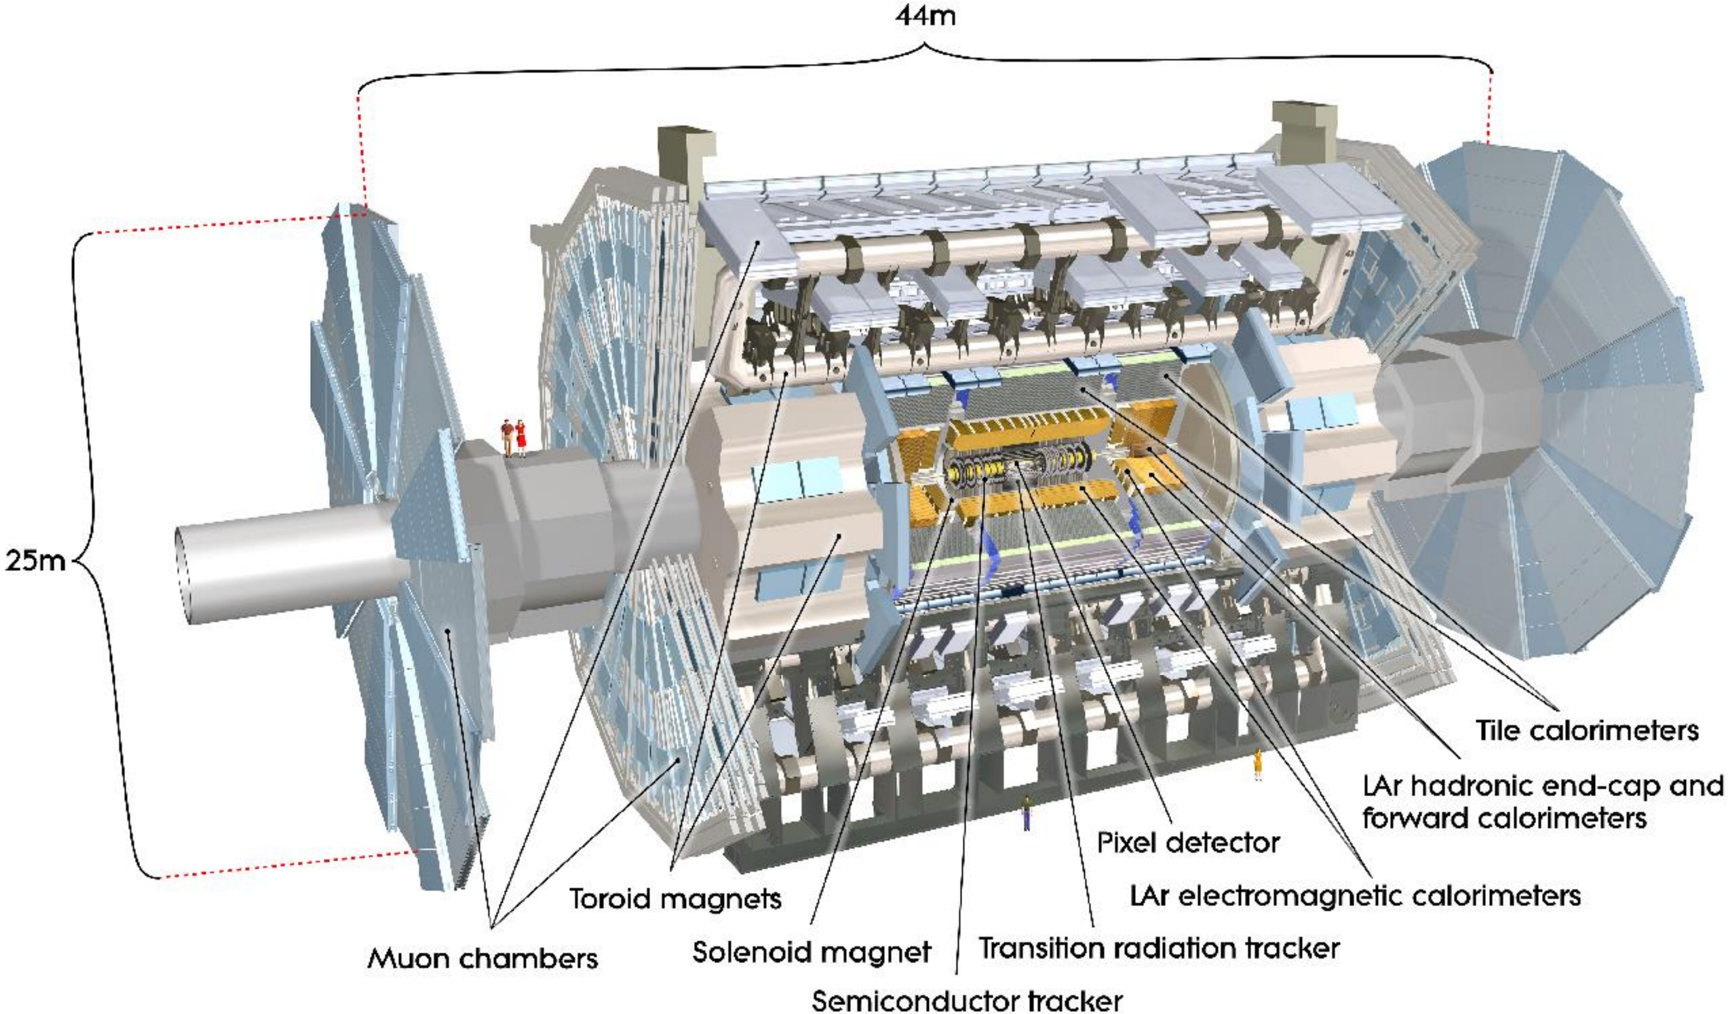
Dimuon pair with an invariant mass of 881 GeV



Conclusions

- During Run 1, ATLAS has produced a large variety of results covering some of the more fundamental questions in particle physics.
- This includes searches, measurements and interpretations within alternative theories.
- The 2012 discovered particle looks really more and more like the SM Higgs boson.
- No signal spotted yet beyond the Standard Model.
- Run 2 has started successfully and ATLAS is willing to continue its effort.
- We all hope for some nice surprises from Nature…

Back up



- Main assets of ATLAS :
  - A precise tracker, able to distinguish primary vertices of a single collision as well as tracks in dense core hadronic jets.
  - A hermetic calorimeter, with angular measurement capabilities.
  - A precise, independent and high redundancy muon system.

CP-Mixing Terms in HVV ?

- Fits exclude maximal scenarii for such terms :
