Introduction – Quark confinement

Confinement : colored state cannot be observed
 only color-singlet states can be observed

(quark, gluon, ···)
 (meson, baryon, ···)

Polyakov loop : order parameter for quark deconfinement phase transition

$$L_P(\mathbf{x}) = \text{tr} \mathbb{T} e^{ig \int_0^\beta d\tau A_4(\mathbf{x}, \tau)} \quad \text{in continuum theory}$$

$$= \text{tr} \prod_{s_4=1}^{N_\tau} U_4(\mathbf{s}, s_4) \quad \text{in lattice theory}$$

Finite temperature :
 (anti) periodic boundary condition for time direction

$$\langle L_P \rangle = \frac{1}{V} \sum_{\mathbf{x}} \langle L_P(\mathbf{x}) \rangle \quad \text{:Polyakov loop}$$

$$= e^{-\beta F_q} \begin{cases} = 0 & (F_q = \infty, \text{confinement phase}) \\ \neq 0 & (F_q : \text{finite, deconfinement phase}) \end{cases}$$

F_q : free energy of the system
 with a single static quark

Polyakov loop fluctuations

P.M. Lo, B. Friman, O. Kaczmarek, K. Redlich and C. Sasaki,
Phys. Rev. D88, 014506 (2013); Phys. Rev. D88, 074502 (2013)

• Polyakov loop: $L \equiv \frac{1}{N_c V} \sum_s \text{tr}_c \left\{ \prod_{i=0}^{N_\tau-1} U_4(s + i\hat{4}) \right\}$

• Z3 rotated Polyakov loop: $\tilde{L} = L e^{2\pi k i / 3}$

• longitudinal Polyakov loop: $L_L \equiv \text{Re}(\tilde{L})$

• Transverse Polyakov loop: $L_T \equiv \text{Im}(\tilde{L})$

• Polyakov loop susceptibilities:

$$T^3 \chi_A = \frac{N_\sigma^3}{N_\tau^3} [\langle |L|^2 \rangle - \langle |L| \rangle^2],$$

$$T^3 \chi_L = \frac{N_\sigma^3}{N_\tau^3} [\langle (L_L)^2 \rangle - \langle L_L \rangle^2],$$

$$T^3 \chi_T = \frac{N_\sigma^3}{N_\tau^3} [\langle (L_T)^2 \rangle - \langle L_T \rangle^2]$$

• Ratios of Polyakov loop susceptibilities:

$$R_A \equiv \frac{\chi_A}{\chi_L}, \quad R_T \equiv \frac{\chi_T}{\chi_L}$$

T : temperature

N_σ, N_τ : spatial and temporal lattice size

**In particular,
 R_A is a sensitive probe
for deconfinement transition**

✂ $n_f=0$: quenched level

**$n_f=2+1$: (2+1) flavor full QCD
(near physical point)**

Polyakov loop fluctuations

P.M. Lo, B. Friman, O. Kaczmarek, K. Redlich and C. Sasaki,
Phys. Rev. D88, 014506 (2013); Phys. Rev. D88, 074502 (2013)

• Polyakov loop: $L \equiv \frac{1}{N_c V} \sum_s \text{tr}_c \left\{ \prod_{i=0}^{N_\tau-1} U_4(s + i\hat{4}) \right\}$

• Z3 rotated Polyakov loop: $\tilde{L} = L e^{2\pi ki/3}$

• longitudinal Polyakov loop: $L_L \equiv \text{Re}(\tilde{L})$

• Transverse Polyakov loop: $L_T \equiv \text{Im}(\tilde{L})$

$$T^3 \chi_L = \frac{N_\sigma^3}{N_\tau^3} [\langle (L_L)^2 \rangle - \langle L_L \rangle^2],$$

$$T^3 \chi_T = \frac{N_\sigma^3}{N_\tau^3} [\langle (L_T)^2 \rangle - \langle L_T \rangle^2]$$

• Ratios of Polyakov loop susceptibilities:

$$R_A \equiv \frac{\chi_A}{\chi_L}, \quad R_T \equiv \frac{\chi_T}{\chi_L}$$

T : temperature

N_σ, N_τ : spatial and temporal lattice size

**In particular,
 R_A is a sensitive probe
for deconfinement transition**

**R_A is a good probe for deconfinement transition
even if considering light dynamical quarks.**

Introduction – Chiral Symmetry Breaking

- Chiral symmetry breaking : chiral symmetry is spontaneously broken

$$SU(N)_L \times SU(N)_R \xrightarrow{\text{CSB}} SU(N)_V$$

for example $SU(2)$

- u, d quarks get dynamical mass(constituent mass)
- Pions appear as NG bosons

- Chiral condensate : order parameter for chiral phase transition

$$\langle \bar{q}q \rangle \begin{cases} \neq 0 & \text{(chiral broken phase)} \\ = 0 & \text{(chiral restored phase)} \end{cases}$$

- Banks-Casher relation

$$\langle \bar{q}q \rangle = - \lim_{m \rightarrow 0} \lim_{V \rightarrow \infty} \pi \langle \rho(0) \rangle$$

\hat{D} :Dirac operator

$\hat{D}|n\rangle = i\lambda_n|n\rangle$:Dirac eigenvalue equation

$\rho(\lambda) = \frac{1}{V} \sum_n \delta(\lambda - \lambda_n)$:Dirac eigenvalue density

QCD phase transition at finite temperature

F. Karsch, Lect. Notes Phys. 583, 209 (2002)

$\langle L \rangle, \chi_L$: Polyakov loop and its susceptibility

$\langle \bar{\psi}\psi \rangle, \chi_m$: chiral condensate and its susceptibility

deconfinement transition

chiral transition

- $\mu = 0$
- two flavor QCD with light quarks

QCD phase transition at finite temperature

F. Karsch, Lect. Notes Phys. 583, 209 (2002)

$\langle L \rangle, \chi_L$: Polyakov loop and its susceptibility

$\langle \bar{\psi}\psi \rangle, \chi_m$: chiral condensate and its susceptibility

deconfinement transition

chiral transition

- $\mu = 0$
- two flavor QCD with light quarks

We define critical temperature as the peak of susceptibility

These two phenomena are strongly correlated(?)

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

TMD, H. Suganuma, T. Iritani, Phys. Rev. D 90, 094505 (2014).
H. Suganuma, TMD, T. Iritani, arXiv: 1404.6494 [hep-lat].

$$L = -\frac{(2ai)^{N_\tau-1}}{12V} \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle \quad \text{on temporally odd number lattice: } N_\tau \text{ is odd}$$

notation:

▪ Polyakov loop : L

▪ link variable operator : $\langle s | \hat{U}_\mu | s' \rangle = U_\mu(s) \delta_{s+\hat{\mu}, s'}$

with anti p.b.c. for time direction: $\langle N_\tau, \mathbf{x} | \hat{U}_4 | 1, \mathbf{x} \rangle = -U_4(N_\tau, \mathbf{x})$

▪ Dirac eigenmode : $\hat{D} | n \rangle = i\lambda_n | n \rangle$

Dirac operator : $\hat{D} = \frac{1}{2a} \sum_\mu \gamma_\mu (\hat{U}_\mu - \hat{U}_{-\mu}) \quad \sum_n | n \rangle \langle n | = 1$

- This analytical formula is a general and mathematical identity.
 - valid in full QCD and at the quenched level.
 - holds for each gauge-configuration $\{U\}$
 - holds for arbitrary fermionic kernel $K[U]$

$$Z = \int \mathcal{D}\bar{q} \mathcal{D}q \mathcal{D}U e^{-S_G[U] + \bar{q} K[U] q} = \int \mathcal{D}U e^{-S_G[U]} \det K[U]$$

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

In this study, we use

- standard square lattice
- with ordinary periodic boundary condition for gluons,
- with the odd temporal length N_τ
(temporally odd-number lattice)

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

In this study, we use

- standard square lattice
- with ordinary periodic boundary condition for gluons,
- with the odd temporal length N_τ
(temporally odd-number lattice)

Note: in the continuum limit of $a \rightarrow 0, N_4 \rightarrow \infty$,
any number of large N_τ gives the same result.

Then, it is no problem to use the odd-number lattice.

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

In this study, we use

- standard square lattice
- with ordinary periodic boundary condition for gluons,
- with the odd temporal length N_τ
(temporally odd-number lattice)

For the simple notation,
we take the lattice unit $a=1$ hereafter.

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

In general, only gauge-invariant quantities such as Closed Loops and the Polyakov loop survive in QCD. (Elitzur's Theorem)

All the non-closed lines are gauge-variant and their expectation values are zero.

($\text{Tr} \square \downarrow = 0$) Nonclosed Lines

e.g.

$$\text{Tr} \hat{U}_4 \hat{U}_1 \hat{U}_{-4} = \sum_s \text{tr} \{ U_4(s) U_1(s + \hat{4}) U_4^\dagger(s + \hat{1}) \} \delta_{s, s + \hat{1}} = 0$$

gauge-variant

$$\langle s | \hat{U}_\mu | s' \rangle = U_\mu(s) \delta_{s + \hat{\mu}, s'}$$

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

In general, only gauge-invariant quantities such as Closed Loops and the Polyakov loop survive in QCD. (Elitzur's Theorem)

All the non-closed lines are gauge-variant and their expectation values are zero.

e.g.

$$\text{Tr} \hat{U}_4 \hat{U}_1 \hat{U}_{-4} = \sum_s \text{tr} \{ U_4(s) U_1(s + \hat{4}) U_4^\dagger(s + \hat{1}) \} \delta_{s, s + \hat{1}} = 0 \quad (\text{Tr} \square \downarrow = 0)$$

gauge-variant

Key point

Note: any closed loop needs even-number link-variables on the square lattice.

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

We consider the functional trace I on the temporally odd-number lattice:

$$I \equiv \text{Tr}_{c,\gamma}(\hat{U}_4 \hat{\mathcal{D}}^{N_\tau-1}) \quad (N_\tau : \text{odd})$$

definition:

$$\langle s | \hat{U}_\mu | s' \rangle = U_\mu(s) \delta_{s+\hat{\mu},s'}$$

$$\text{Tr}_{c,\gamma} \equiv \sum_s \text{tr}_c \text{tr}_\gamma$$

site & color & spinor

Dirac operator : $\hat{\mathcal{D}} = \frac{1}{2} \sum_\mu \gamma_\mu (\hat{U}_\mu - \hat{U}_{-\mu})$

$\hat{U}_4 \hat{\mathcal{D}}^{N_\tau-1}$ is expressed as a sum of products of N_τ link-variable operators because the Dirac operator $\hat{\mathcal{D}}$ includes one link-variable operator in each direction $\hat{\mu}$.

$I \equiv \text{Tr}_{c,\gamma}(\hat{U}_4 \hat{\mathcal{D}}^{N_\tau-1})$ includes many trajectories on the square lattice.

$N_\tau = 3$ case

length of trajectories: $\underline{N_\tau = 3}$
odd !!

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

We consider the functional trace I on the temporally odd-number lattice:

$$I \equiv \text{Tr}_{c,\gamma}(\hat{U}_4 \hat{D}^{N_\tau-1}) \quad (N_\tau : \text{odd})$$

definition:

$$\langle s | \hat{U}_\mu | s' \rangle = U_\mu(s) \delta_{s+\hat{\mu}, s'}$$

$$\text{Tr}_{c,\gamma} \equiv \sum_s \text{tr}_c \text{tr}_\gamma$$

site & color & spinor

Dirac operator: $\hat{D} = \frac{1}{2} \sum_\mu \gamma_\mu (\hat{U}_\mu - \hat{U}_{-\mu})$

$\hat{U}_4 \hat{D}^{N_\tau-1}$ is expressed as a sum of products of N_τ link-variable operators because the Dirac operator \hat{D} includes one link-variable operator in each direction $\hat{\mu}$.

$I \equiv \text{Tr}_{c,\gamma}(\hat{U}_4 \hat{D}^{N_\tau-1})$ includes many trajectories on the square lattice.

$N_\tau = 3$ case

length of trajectories: $N_\tau = 3$
odd !!

Key point

Note: any closed loop needs even-number link-variables on the square lattice.

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

$$I \equiv \text{Tr}_{c,\gamma}(\hat{U}_4 \hat{\mathcal{D}}^{N_\tau-1}) \quad (N_\tau : \text{odd})$$

$$\text{Dirac operator : } \hat{\mathcal{D}} = \frac{1}{2} \sum_{\mu} \gamma_{\mu} (\hat{U}_{\mu} - \hat{U}_{-\mu})$$

In this functional trace $I \equiv \text{Tr}_{c,\gamma}(\hat{U}_4 \hat{\mathcal{D}}^{N_\tau-1})$, it is impossible to form a closed loop on the square lattice, because the length of the trajectories, N_τ , is odd.

Almost all trajectories are **gauge-variant** & give **no contribution**.

$N_\tau = 3$ case

4 ↑

gauge variant
(no contribution)

Only the **exception** is the **Polyakov loop**.

$N_\tau = 3$ case

4 ↑

gauge invariant !!

I is proportional to the Polyakov loop.

$$I \propto L_P$$

L_P : Polyakov loop

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

On the one hand,

$$I = \frac{12V}{2^{N_\tau-1}} L_P \quad \dots \textcircled{1}$$

On the other hand, take the Dirac modes as the basis for functional trace

$$\begin{aligned} I &= \text{Tr}_{c,\gamma}(\hat{U}_4 \hat{D}^{N_\tau-1}) \\ &= \sum_n \langle n | \hat{U}_4 \hat{D}^{N_\tau-1} | n \rangle \\ &= i^{N_\tau-1} \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle \quad \dots \textcircled{2} \end{aligned}$$

Dirac eigenmode

$$\begin{aligned} \hat{D} | n \rangle &= i \lambda_n | n \rangle \\ \sum_n | n \rangle \langle n | &= 1 \end{aligned}$$

from $\textcircled{1}$ 、 $\textcircled{2}$

$$L_P = \frac{(2i)^{N_\tau-1}}{12V} \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle$$

Note 1: this relation holds gauge-independently. (No gauge-fixing)

Note 2: this relation does not depend on lattice fermion for sea quarks.

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

TMD, H. Suganuma, T. Iritani, Phys. Rev. D 90, 094505 (2014).
H. Suganuma, TMD, T. Iritani, arXiv: 1404.6494 [hep-lat].

$$L = -\frac{(2ai)^{N_\tau-1}}{12V} \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle \quad \text{on temporally odd number lattice: } N_\tau \text{ is odd}$$

notation:

- Polyakov loop : L

- link variable operator : $\langle s | \hat{U}_\mu | s' \rangle = U_\mu(s) \delta_{s+\hat{\mu}, s'}$

with anti p.b.c. for time direction: $\langle N_\tau, \mathbf{x} | \hat{U}_4 | 1, \mathbf{x} \rangle = -U_4(N_\tau, \mathbf{x})$

- Dirac eigenmode : $\hat{D} | n \rangle = i \lambda_n | n \rangle$

$$\text{Dirac operator : } \hat{D} = \frac{1}{2a} \sum_\mu \gamma_\mu (\hat{U}_\mu - \hat{U}_{-\mu}) \quad \sum_n | n \rangle \langle n | = 1$$

properties :

- This formula is valid in full QCD and at the quenched level.

- This formula exactly holds for each gauge-configuration $\{U\}$ and for arbitrary fermionic kernel $K[U]$

$$Z = \int \mathcal{D}\bar{q} \mathcal{D}q \mathcal{D}U e^{-S_G[U] + \bar{q} K[U] q} = \int \mathcal{D}U e^{-S_G[U]} \det K[U]$$

An analytical relation between Polyakov loop and Dirac mode on temporally odd-number lattice

TMD, H. Suganuma, T. Iritani, Phys. Rev. D 90, 094505 (2014).
H. Suganuma, TMD, T. Iritani, arXiv: 1404.6494 [hep-lat].

$$L = -\frac{(2ai)^{N_\tau-1}}{12V} \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle \quad \text{on temporally odd number lattice: } N_4 \text{ is odd}$$

notation:

- Polyakov loop : L

- link variable operator : $\langle s | \hat{U}_\mu | s' \rangle = U_\mu(s) \delta_{s+\hat{\mu}, s'}$

with anti p.b.c. for time direction: $\langle N_\tau, \mathbf{x} | \hat{U}_4 | 1, \mathbf{x} \rangle = -U_4(N_\tau, \mathbf{x})$

- Dirac eigenmode : $\hat{D} | n \rangle = i \lambda_n | n \rangle$

$$\text{Dirac operator : } \hat{D} = \frac{1}{2a} \sum_\mu \gamma_\mu (\hat{U}_\mu - \hat{U}_{-\mu}) \quad \sum_n |n\rangle \langle n| = 1$$

properties :

- This formula is valid in full QCD and at the quenched level.

- This formula exactly holds for each gauge-configuration $\{U\}$ and for arbitrary fermionic kernel $K[U]$

$$Z = \int \mathcal{D}\bar{q} \mathcal{D}q \mathcal{D}U e^{-S_G[U] + \bar{q} K[U] q} = \int \mathcal{D}U e^{-S_G[U]} \det K[U]$$

We derived the similar relation between **Wilson loop** and Dirac mode. Therefore, we can also show that low-lying Dirac modes have little contribution to the **string tension σ** , namely the confining force.

Analytical relation between Polyakov loop and Dirac modes with twisted boundary condition

C. Gattringer, Phys. Rev. Lett. 97 (2006) 032003.

$$L = \frac{1}{8V} \left(2 \sum_{\lambda} \lambda^{N_4} - (1+i) \sum_{\lambda_+} \lambda_+^{N_4} - (1-i) \sum_{\lambda_-} \lambda_-^{N_4} \right)$$

twisted boundary condition:

$$U_4(\mathbf{x}, N_4) \rightarrow \pm i U_4(\mathbf{x}, N_4), \quad \forall \mathbf{x} \quad \lambda \quad : \text{Eigenvalue of } D(x|y)$$

$$D(x, y) \rightarrow D_{\pm}(x, y) \quad \lambda_{\pm} \quad : \text{Eigenvalue of } D_{\pm}(x|y)$$

$$D(x|y) = (4+m)\delta_{x,y} - \frac{1}{2} \sum_{\mu=\pm 1}^{\pm 4} [1 \mp \gamma_{\mu}] U_{\mu}(x) \delta_{x+\mu,y} \quad : \text{Wilson Dirac operator}$$

The twisted boundary condition is not the periodic boundary condition.

However,

the temporal periodic boundary condition is physically important for the imaginary-time formalism at finite temperature.

(The b.c. for link-variables is p.b.c., but the b.c. for Dirac operator is twisted b.c.)

Dirac spectrum representation of the Polyakov loop fluctuations

TMD, K. Redlich, C. Sasaki and H. Suganuma, arXiv: 1505.05752 [hep-lat]

Definition of the Polyakov loop fluctuations

- Polyakov loop: $L \equiv \frac{1}{N_c V} \sum_s \text{tr}_c \left\{ \prod_{i=0}^{N_\tau-1} U_4(s + i\hat{4}) \right\}$
- Z3 rotated Polyakov loop: $\tilde{L} = L e^{2\pi k i/3}$
- longitudinal Polyakov loop: $L_L \equiv \text{Re}(\tilde{L})$
- Transverse Polyakov loop: $L_T \equiv \text{Im}(\tilde{L})$
- Polyakov loop susceptibilities:

$$T^3 \chi_A = \frac{N_\sigma^3}{N_\tau^3} [\langle |L|^2 \rangle - \langle |L| \rangle^2],$$

$$T^3 \chi_L = \frac{N_\sigma^3}{N_\tau^3} [\langle (L_L)^2 \rangle - \langle L_L \rangle^2],$$

$$T^3 \chi_T = \frac{N_\sigma^3}{N_\tau^3} [\langle (L_T)^2 \rangle - \langle L_T \rangle^2]$$

- Ratios of Polyakov loop susceptibilities:

$$R_A \equiv \frac{\chi_A}{\chi_L}, \quad R_T \equiv \frac{\chi_T}{\chi_L}$$

P.M. Lo, B. Friman, O. Kaczmarek, K. Redlich and C. Sasaki,
Phys. Rev. D88, 014506 (2013); Phys. Rev. D88, 074502 (2013)

R_A is a good probe for deconfinement transition even if considering dynamical quarks.

Dirac spectrum representation of the Polyakov loop fluctuations

TMD, K. Redlich, C. Sasaki and H. Suganuma, arXiv: 1505.05752 [hep-lat]

Definition of the Polyakov loop fluctuations

combine

Dirac spectrum representation of the Polyakov loop fluctuations

For example,

$$L_L = -\frac{(2ai)^{N_\tau-1}}{12V} \sum_n \lambda_n^{N_\tau-1} \text{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right)$$

and...

Dirac spectrum representation of the Polyakov loop fluctuations

TMD, K. Redlich, C. Sasaki and H. Suganuma, arXiv: 1505.05752 [hep-lat]

In particular, the ratio R_A can be represented using Dirac modes:

$$R_A = \frac{\left\langle \left| \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle \right|^2 \right\rangle - \left\langle \left| \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle \right| \right\rangle^2}{\left\langle \left(\sum_n \lambda_n^{N_\tau-1} \text{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right)^2 \right\rangle - \left\langle \sum_n \lambda_n^{N_\tau-1} \text{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right\rangle^2}$$

Note 1: The ratio R_A is a good “order parameter” for deconfinement transition.

Dirac spectrum representation of the Polyakov loop fluctuations

TMD, K. Redlich, C. Sasaki and H. Suganuma, arXiv: 1505.05752 [hep-lat]

In particular, the ratio R_A can be represented using Dirac modes:

$$R_A = \frac{\left\langle \left| \sum_n \lambda_n^{N_\tau - 1} \langle n | \hat{U}_4 | n \rangle \right|^2 \right\rangle - \left\langle \left| \sum_n \lambda_n^{N_\tau - 1} \langle n | \hat{U}_4 | n \rangle \right| \right\rangle^2}{\left\langle \left(\sum_n \lambda_n^{N_\tau - 1} \operatorname{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right)^2 \right\rangle - \left\langle \sum_n \lambda_n^{N_\tau - 1} \operatorname{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right\rangle^2}$$

Note 1: The ratio R_A is a good “order parameter” for deconfinement transition.

Note 2: Since the **damping factor** $\lambda_n^{N_\tau - 1}$ is very small with small $|\lambda_n| \simeq 0$, low-lying Dirac modes (with small $|\lambda_n| \simeq 0$) are not important for R_A , which are important modes for chiral symmetry breaking.

TMD, K. Redlich, C. Sasaki and H. Suganuma, arXiv: 1505.05752 [hep-lat]

In particular, the ratio R_A can be represented using Dirac modes:

$$R_A = \frac{\left\langle \left| \sum_n \lambda_n^{N_\tau - 1} \langle n | \hat{U}_4 | n \rangle \right|^2 \right\rangle - \left\langle \left| \sum_n \lambda_n^{N_\tau - 1} \langle n | \hat{U}_4 | n \rangle \right| \right\rangle^2}{\left\langle \left(\sum_n \lambda_n^{N_\tau - 1} \operatorname{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right)^2 \right\rangle - \left\langle \sum_n \lambda_n^{N_\tau - 1} \operatorname{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right\rangle^2}$$

Note 1: The ratio R_A is a good “order parameter” for deconfinement transition.

Note 2: Since the **damping factor** $\lambda_n^{N_\tau - 1}$ is very small with small $|\lambda_n| \simeq 0$, low-lying Dirac modes (with small $|\lambda_n| \simeq 0$) are not important for R_A , which are important modes for chiral symmetry breaking.

Thus, the essential modes for chiral symmetry breaking in QCD are not important to quantify the Polyakov loop fluctuation ratios, which are sensitive observables to confinement properties in QCD.

In particular, the ratio R_A can be represented using Dirac modes:

$$R_A = \frac{\left\langle \left| \sum_n \lambda_n^{N_\tau - 1} \langle n | \hat{U}_4 | n \rangle \right|^2 \right\rangle - \left\langle \left| \sum_n \lambda_n^{N_\tau - 1} \langle n | \hat{U}_4 | n \rangle \right| \right\rangle^2}{\left\langle \left(\sum_n \lambda_n^{N_\tau - 1} \operatorname{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right)^2 \right\rangle - \left\langle \sum_n \lambda_n^{N_\tau - 1} \operatorname{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right\rangle^2}$$

Note 1: The ratio R_A is a good “order parameter” for deconfinement transition.

Note 2: Since the **damping factor** $\lambda_n^{N_\tau - 1}$ is very small with small $|\lambda_n| \simeq 0$, low-lying Dirac modes (with small $|\lambda_n| \simeq 0$) are not important for R_A , which are important modes for chiral symmetry breaking.

Thus, the essential modes for chiral symmetry breaking in QCD are not important to quantify the Polyakov loop fluctuation ratios, which are sensitive observables to confinement properties in QCD.

This result suggests that there is no direct, one-to-one correspondence between confinement and chiral symmetry breaking in QCD.

Introduction of the Infrared cutoff for Dirac modes

TMD, K. Redlich, C. Sasaki and H. Suganuma, arXiv: 1505.05752 [hep-lat]

Define Λ -dependent (IR-cut) susceptibilities:

$$(\chi)_\Lambda = \frac{1}{T^3} \frac{N_\sigma^3}{N_\tau^3} [\langle Y_\Lambda^2 \rangle - \langle Y_\Lambda \rangle^2], \quad Y \equiv |L|, L_L, L_T$$

$$\text{where, for example, } (L_L)_\Lambda = C_\tau \sum_{|\lambda_n| > \Lambda} \lambda_n^{N_\tau - 1} \text{Re} \left(e^{2\pi k i / 3} (n | \hat{U}_4 | n) \right)$$

Define Λ -dependent (IR-cut) ratio of susceptibilities:

$$(R_A)_\Lambda = \frac{(\chi_A)_\Lambda}{(\chi_L)_\Lambda}$$

Define Λ -dependent (IR-cut) chiral condensate:

$$\langle \bar{\psi} \psi \rangle_\Lambda = -\frac{1}{V} \sum_{|\lambda_n| \geq \Lambda} \frac{2m}{\lambda_n^2 + m^2}$$

Define the ratios, which indicate the influence of removing the low-lying Dirac modes:

$$R_{\text{conf}} = \frac{(R_A)_\Lambda}{R_A}, \quad R_{\text{chiral}} = \frac{\langle \bar{\psi} \psi \rangle_\Lambda}{\langle \bar{\psi} \psi \rangle}$$

Numerical analysis

$$R_{\text{conf}} = \frac{(R_A)_\Lambda}{R_A}, \quad R_{\text{chiral}} = \frac{\langle \bar{\psi}\psi \rangle_\Lambda}{\langle \bar{\psi}\psi \rangle}$$

lattice setup:

- quenched SU(3) lattice QCD
- standard plaquette action
- gauge coupling: $\beta = \frac{2N_c}{g^2} = 5.6$
- lattice size: $N_\sigma^3 \times N_\tau = 10^3 \times 5$
 \Leftrightarrow lattice spacing : $a \simeq 0.25$ fm
- periodic boundary condition
 for link-variables and Dirac operator

- R_{chiral} is strongly reduced by removing the low-lying Dirac modes.
- R_{conf} is almost unchanged.

It is also numerically confirmed that low-lying Dirac modes are important for chiral symmetry breaking and not important for quark confinement.

Summary

TMD, K. Redlich, C. Sasaki and H. Suganuma,
arXiv: 1505.05752 [hep-lat]

1. We have derived the analytical relation between **Polyakov loop fluctuations** and **Dirac eigenmodes** on temporally odd-number lattice:

$$\text{e.g.) } R_A = \frac{\left\langle \left| \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle \right|^2 \right\rangle - \left\langle \left| \sum_n \lambda_n^{N_\tau-1} \langle n | \hat{U}_4 | n \rangle \right| \right\rangle^2}{\left\langle \left(\sum_n \lambda_n^{N_\tau-1} \text{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right)^2 \right\rangle - \left\langle \sum_n \lambda_n^{N_\tau-1} \text{Re} \left(e^{2\pi k i / 3} \langle n | \hat{U}_4 | n \rangle \right) \right\rangle^2}$$

N_τ : odd

Dirac eigenmode : $\hat{D}|n\rangle = i\lambda_n|n\rangle$

Link variable operator :

$$\langle s | \hat{U}_\mu | s' \rangle = U_\mu(s) \delta_{s+\hat{\mu}, s'}$$

$$\langle N_\tau, \mathbf{x} | \hat{U}_4 | 1, \mathbf{x} \rangle = -U_4(N_\tau, \mathbf{x})$$

2. We have semi-analytically and numerically confirmed that low-lying Dirac modes are not important to quantify the Polyakov loop fluctuation ratios, which are sensitive observables to confinement properties in QCD.

3. Our results suggest that there is **no direct one-to-one correspondence between confinement and chiral symmetry breaking in QCD.**

Why Polyakov loop fluctuations?

P.M. Lo, B. Friman, O. Kaczmarek, K. Redlich and C. Sasaki,
Phys. Rev. D88, 014506 (2013); Phys. Rev. D88, 074502 (2013)

Ans. 1: Avoiding ambiguities of the Polyakov loop renormalization

$$L^{\text{ren}} = Z(g^2)L^{\text{bare}}, \quad L^{\text{bare}} \equiv \frac{1}{N_c V} \sum_s \text{tr}_c \left\{ \prod_{i=0}^{N_\tau-1} U_4(s + i\hat{4}) \right\}$$

$Z(g^2)$: renormalization function for the Polyakov loop, which is still **unknown**

Avoid the ambiguity of renormalization function
by considering the ratios of Polyakov loop susceptibilities:

$$R_A \equiv \frac{\chi_A}{\chi_L}, \quad R_T \equiv \frac{\chi_T}{\chi_L}$$

λ_n v.s. $(n|\hat{U}_4|n)$, $\lambda_n^{N_4-1}(n|\hat{U}_4|n)$

$$L_P = \frac{(2i)^{N_4-1}}{3V} \sum_n \lambda_n^{N_4-1} (n|\hat{U}_4|n)$$

$\beta = 5.6$
lattice size : $10^3 \times 5$

$\langle L_P \rangle = 0$
(confined phase)

$\hat{D}|n\rangle = i\lambda_n|n\rangle$
Dirac eigenvalue: $i\lambda_n$

λ_n v.s. $(n|\hat{U}_4|n)$, $\lambda_n^{N_4-1}(n|\hat{U}_4|n)$

$$L_P = \frac{(2i)^{N_4-1}}{3V} \sum_n \lambda_n^{N_4-1} (n|\hat{U}_4|n)$$

$\beta = 5.6$
lattice size : $10^3 \times 5$

$\langle L_P \rangle = 0$
(confined phase)

$\mathcal{D}|n\rangle = i\lambda_n|n\rangle$
Dirac eigenvalue: $i\lambda_n$

confined phase

$\langle L \rangle = 0$ is due to the symmetric distribution of positive/negative value of $(n|\hat{U}_4|n)$, $\lambda_n^{N_4-1}(n|\hat{U}_4|n)$

Low-lying Dirac modes have little contribution to Polyakov loop.

$$\lambda_n \text{ v.s. } (n|\hat{U}_4|n) , \lambda_n^{N_4-1} (n|\hat{U}_4|n)$$

$$L_P = \frac{(2i)^{N_4-1}}{3V} \sum_n \lambda_n^{N_4-1} (n|\hat{U}_4|n)$$

$\beta = 6.0$
lattice size : $10^3 \times 5$

$\langle L_P \rangle \neq 0$
(deconfined phase)

$$\hat{D}|n\rangle = i\lambda_n|n\rangle$$

Dirac eigenvalue: $i\lambda_n$

We mainly investigate the real Polyakov-loop vacuum, where the Polyakov loop is real, so only real part is different from it in confined phase.

$$\lambda_n \text{ v.s. } (n|\hat{U}_4|n), \lambda_n^{N_4-1} (n|\hat{U}_4|n)$$

$$L_P = \frac{(2i)^{N_4-1}}{3V} \sum_n \lambda_n^{N_4-1} (n|\hat{U}_4|n)$$

$$\beta = 6.0$$

lattice size : $10^3 \times 5$

Polyakov loop L

$$\langle L_P \rangle \neq 0$$

(deconfined phase)

$$\mathcal{D}|n\rangle = i\lambda_n|n\rangle$$

Dirac eigenvalue: $i\lambda_n$

In low-lying Dirac modes region, $\text{Re}(n|\hat{U}_4|n)$ has a large value,
but contribution of low-lying (IR) Dirac modes to Polyakov loop is very small
because of dumping factor $\lambda_n^{N_4-1}$
