

# Search for sterile neutrino mixing in the $\nu_\mu \rightarrow \nu_\tau$ appearance channel with the OPERA detector

Nicoletta Mauri

(INFN-Bologna)

*on behalf of the OPERA Collaboration*

4<sup>th</sup> International Conference on New Frontiers in Physics, ICNFP 2015  
Kolymbari, Crete, August 26<sup>th</sup>, 2015

# Outline

- **Physics motivations**
  - **sterile neutrinos**
- **The OPERA experiment**
  - **detector and physics case**
- **Sterile neutrino mixing search**
  - **3+1 model**
  - **$\nu_\mu \rightarrow \nu_\tau$  appearance channel**
- **Conclusions**

# Introduction

- In the last decades **several experiments provided evidence for neutrino oscillations**: conversion in-flight of lepton flavor
  - 3 neutrino paradigm** well established
  - mixing matrix parameters** precisely measured

BUT

- A certain number of *anomalies* shows tensions with the 3 flavor framework, both in appearance and in disappearance modes

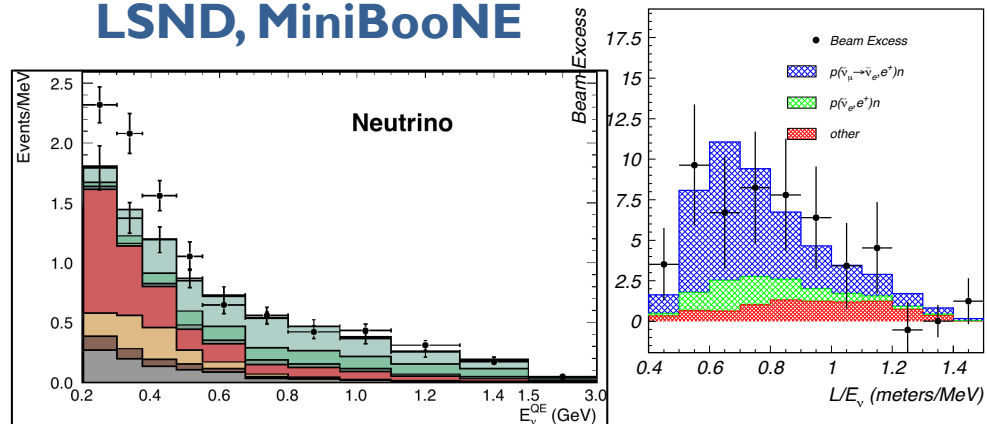

## Appearance

anti- $\nu_\mu \rightarrow$  anti- $\nu_e$

## Disappearance

$\nu_e$ , anti- $\nu_e$

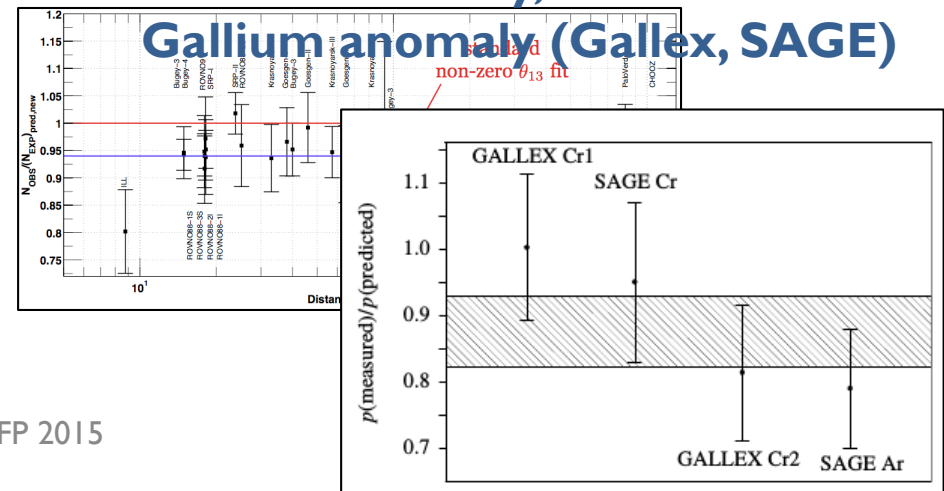

### LSND, MiniBooNE

26 August 2015

N. Mauri, ICNFP 2015

### Reactor anomaly, Gallium anomaly (Gallex, SAGE)

# Sterile neutrinos

- Anomalies point toward a new parameter region  $\Delta m^2 \sim eV^2$ 
  - “only” 3 active neutrinos ( $N_{\text{active}} = 3$ , bound by the the Z invisible decay width measured at LEP)

→ **Sterile neutrino hypothesis** [Pontecorvo, JETP 26 (1968) 984]

- The new model should include the standard 3ν framework
  - Perturbation of 3ν mixing

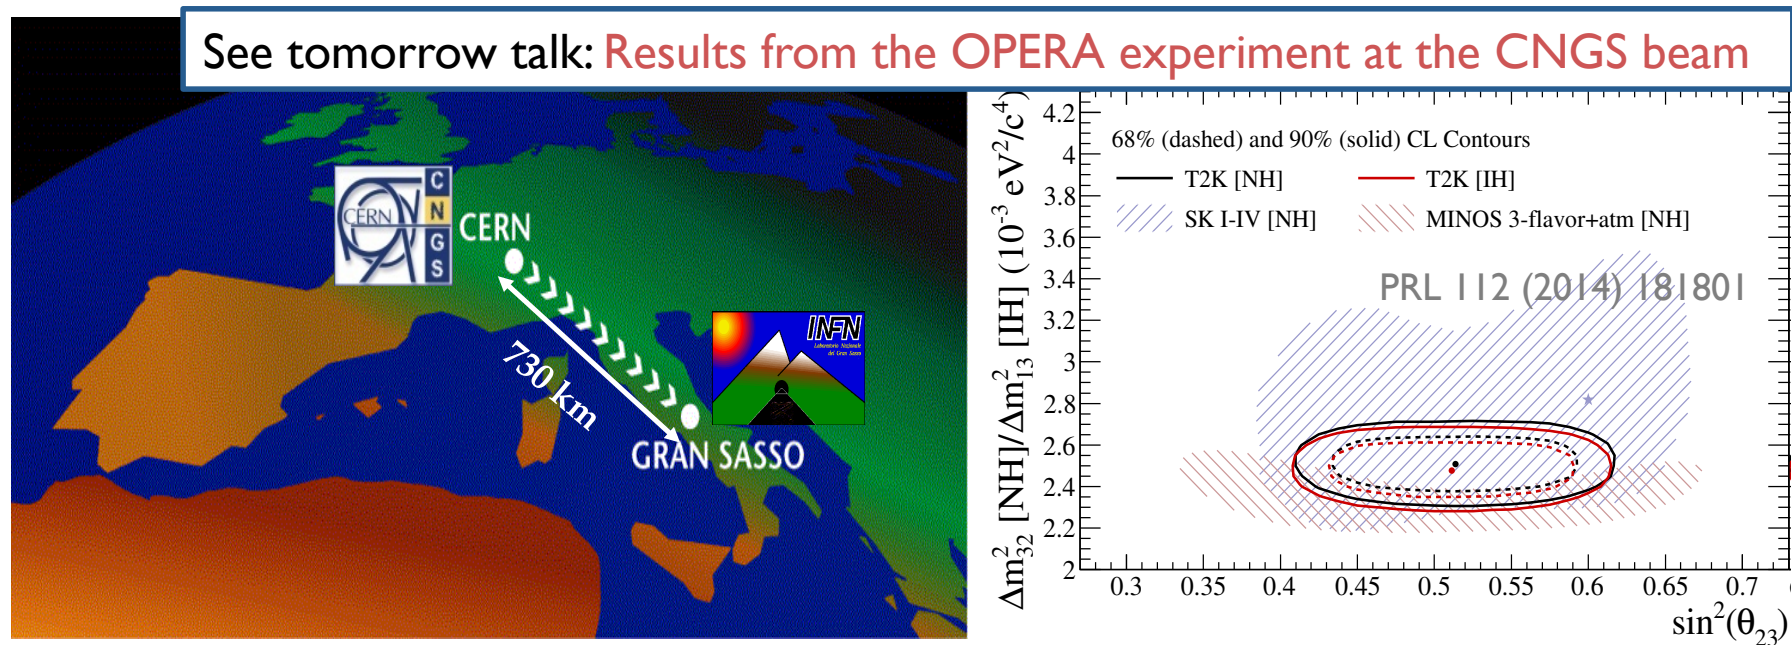

C. Giunti @ EPS-HEP 2015

- OPERA can test the sterile neutrino hypothesis in the  $\nu_\tau$  **appearance channel** looking for deviations from the standard 3ν model (in addition to the  $\nu_e$  appearance channel) [JHEP 4 (2013) 1307]

# The OPERA experiment

Main physics goal: **prove (standard)  $\nu_\mu \rightarrow \nu_\tau$  oscillations in appearance mode**

Full coverage of the parameter space for the atmospheric neutrino sector

- Long baseline neutrino oscillation experiment located in the CNGS (CERN Neutrinos to Gran Sasso)  $\nu_\mu$  beam
- Direct search for  $\nu_\mu \rightarrow \nu_\tau$  oscillations detecting the  $\tau$  lepton produced in  $\nu_\tau$  CC interactions (**appearance mode**)

# Appearance detection

Direct observation of  $\nu_\mu \rightarrow \nu_\tau$  oscillation

- $N_\tau = N_A M_D \int \phi_{\nu_\mu}(E) P_{\nu_\mu \rightarrow \nu_\tau}(E, \Delta m^2) \sigma_{\nu_\tau}^{CC}(E) \varepsilon(E) dE$  → Large mass  $\sim O(\text{kton})$
- signal selection and background rejection → High granularity  $\sim 1 \mu\text{m}$  resolution

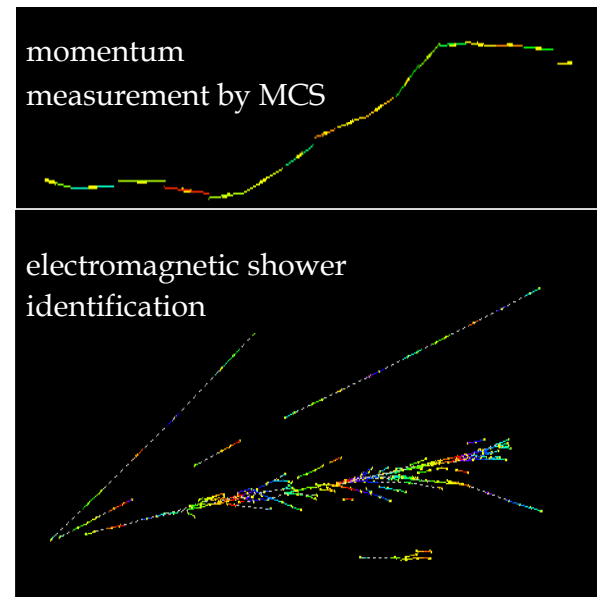

➔ **Emulsion Cloud Chamber**

# Neutrino interaction detector (ECC)

- Target basic unit: brick of 57 nuclear emulsions interleaved by lead plates + 2 interface emulsions (CS)
- high resolution and large mass in a modular way
- unambiguous measurement of the kink

- “stand-alone” detector

# OPERA general structure

Brick: ECC target basic unit  
(57 nuclear emulsion films +  
56 lead plates)

Target section:  
27 brick walls (75000 bricks)  
31 Target Tracker walls (TT)

Neutrino interaction trigger  
Brick selection  
Calorimetry

Magnetic spectrometer:  
22 RPC planes  
6 drift tube layers (PT stations)

$\mu$  ID, charge, momentum

$B = 1.53 \text{ T}$

Total target mass = 1.25 ktons

# OPERA: an hybrid detector

SM 1

SM 2

Background

p-value (likelihood ratio):  $1.1 \times 10^{-7}$   
**Significance:  $5.1\sigma$**

**Discovery of tau neutrino appearance**

Accepted by PRL, arXiv:1507.01417

# Tau appearance in the 3+1 model

Sterile hypothesis test: standard 3ν + 1 sterile

- Consider a **new mass eigenstate**  $m_4$  with  $\Delta m^2_{41}$  up to a few  $eV^2$ , almost exclusively composed by a flavour sterile eigenstate,  $\nu_s$

- **4 x 4 mixing matrix** parameterized by a product of complex rotational matrices

Parameters of interest in  $\nu_\tau$  appearance

$$\begin{bmatrix} U_{e1} & U_{e2} & U_{e3} & U_{e4} \\ U_{\mu1} & U_{\mu2} & U_{\mu3} & U_{\mu4} \\ U_{\tau1} & U_{\tau2} & U_{\tau3} & U_{\tau4} \\ U_{s1} & U_{s2} & U_{s3} & U_{s4} \end{bmatrix}$$

- Number of expected events evaluated as:

$$\mu = N_{\text{bkg}} + K \int \phi(E) P_{\mu\tau}(E) \sigma(E) \varepsilon(E) dE$$

- Both **Normal and Inverted mass Hierarchies** considered

$$[\Delta m^2_{31} > 0 \text{ (NH)}, \Delta m^2_{31} < 0 \text{ (IH)}]$$

$$\Delta m^2_{41} > 0 \quad [\Delta m^2_{41} < 0 \text{ disfavoured by cosmological limits on } \Sigma m_\nu]$$

# 3+1 Model

Oscillation probability in presence of a sterile neutrino becomes:

$$\begin{aligned}
 P(\text{Energy}) &= \boxed{\sim \text{standard oscillation}} + \boxed{\text{pure exotic oscillation}} \\
 &= C^2 \sin^2 \frac{\Delta_{31}}{2} + \sin^2 2\theta_{\mu\tau} \sin^2 \frac{\Delta_{41}}{2} \\
 &\quad + \frac{1}{2} C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin \Delta_{31} \sin \Delta_{41} \\
 &\quad - C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \sin \Delta_{41} \\
 &\quad + 2 C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \sin^2 \frac{\Delta_{41}}{2} \\
 &\quad + C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin \Delta_{31} \sin^2 \frac{\Delta_{41}}{2}
 \end{aligned}$$

neglecting solar driven oscillation  $\Delta_{21} \sim 0$

$$\Delta_{ij} = \frac{\Delta m_{ij}^2 L}{2E}$$

Effective mixing

$$C = 2|U_{\mu 3}||U_{\tau 3}|$$

$$\phi_{\mu\tau} = \text{Arg}(U_{\mu 3}^* U_{\tau 3}^* U_{\mu 4}^* U_{\tau 4}^*)$$

$$\sin 2\theta_{\mu\tau} = 2|U_{\mu 4}||U_{\tau 4}|$$

interference terms

# Sterile effective mixing

Oscillation probability in presence of a sterile neutrino becomes:

$$\begin{aligned}
 P(\text{Energy}) &= \overset{\sim \text{ standard oscillation}}{C^2 \sin^2 \frac{\Delta_{31}}{2}} + \overset{\text{pure exotic oscillation}}{\sin^2 2\theta_{\mu\tau} \sin^2 \frac{\Delta_{41}}{2}} \\
 &+ \frac{1}{2} C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin \Delta_{31} \sin \Delta_{41} \\
 &- C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \sin \Delta_{41} \\
 &+ \overset{\text{interference terms}}{2 C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \sin^2 \frac{\Delta_{41}}{2}} \\
 &+ C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin \Delta_{31} \sin^2 \frac{\Delta_{41}}{2}
 \end{aligned}$$

neglecting solar driven oscillation  $\Delta_{21} \sim 0$

$$\Delta_{ij} = \frac{\Delta m_{ij}^2 L}{2E}$$

Effective mixing

$$C = 2|U_{\mu 3}||U_{\tau 3}|$$

$$\phi_{\mu\tau} = \text{Arg}(U_{\mu 3}^* U_{\tau 3}^* U_{\mu 4}^* U_{\tau 4}^*)$$

$$\sin 2\theta_{\mu\tau} = 2|U_{\mu 4}||U_{\tau 4}|$$

Effective mixing parameter (leading mixing term at SBL)

# Mass hierarchy

Oscillation probability in presence of a sterile neutrino becomes:

$$\begin{aligned}
 P(\text{Energy}) &= \boxed{\sim \text{standard oscillation}} \quad \boxed{\text{pure exotic oscillation}} \\
 &= C^2 \sin^2 \frac{\Delta_{31}}{2} + \sin^2 2\theta_{\mu\tau} \sin^2 \frac{\Delta_{41}}{2} \\
 &+ \frac{1}{2} C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin \Delta_{31} \sin \Delta_{41} \\
 &- C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \sin \Delta_{41} \\
 &+ 2 C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \sin^2 \frac{\Delta_{41}}{2} \\
 &+ C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin \Delta_{31} \sin^2 \frac{\Delta_{41}}{2}
 \end{aligned}$$

neglecting solar driven oscillation  $\Delta_{21} \sim 0$

$$\Delta_{ij} = \frac{\Delta m_{ij}^2 L}{2E}$$

Effective mixing

$$\begin{aligned}
 C &= 2|U_{\mu 3}||U_{\tau 3}| \\
 \phi_{\mu\tau} &= \text{Arg}(U_{\mu 3}^* U_{\tau 3}^* U_{\mu 4}^* U_{\tau 4}^*) \\
 \sin 2\theta_{\mu\tau} &= 2|U_{\mu 4}||U_{\tau 4}|
 \end{aligned}$$

interference terms

Mass Hierarchy dependence

# CP-violation

Oscillation probability in presence of a sterile neutrino becomes:

$$\begin{aligned}
 P(\text{Energy}) &= \boxed{\sim \text{standard oscillation}} \quad \boxed{\text{pure exotic oscillation}} \\
 &= C^2 \sin^2 \frac{\Delta_{31}}{2} + \sin^2 2\theta_{\mu\tau} \sin^2 \frac{\Delta_{41}}{2} \\
 &\quad \boxed{\text{neglecting solar driven oscillation } \Delta_{21} \sim 0} \\
 &\quad + \frac{1}{2} C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin \Delta_{31} \sin \Delta_{41} \\
 &\quad - C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \sin \Delta_{41} \\
 &\quad + 2 C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \sin^2 \frac{\Delta_{41}}{2} \\
 &\quad + C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin \Delta_{31} \sin^2 \frac{\Delta_{41}}{2}
 \end{aligned}$$

CP-violating

interference terms

$$\Delta_{ij} = \frac{\Delta m_{ij}^2 L}{2E}$$

**Effective mixing**

$$\begin{aligned}
 C &= 2|U_{\mu 3}||U_{\tau 3}| \\
 \phi_{\mu\tau} &= \text{Arg}(U_{\mu 3}^* U_{\tau 3}^* U_{\mu 4}^* U_{\tau 4}^*) \\
 \sin 2\theta_{\mu\tau} &= 2|U_{\mu 4}||U_{\tau 4}|
 \end{aligned}$$

# New results

## 5 $\nu_\tau$ candidates

✓ Use **GLoBES** to evaluate number of expected events

✓  $\Delta m_{21}^2$  set constant to  $7.54 \times 10^{-5} \text{ eV}^2$

✓  $\Delta m_{31}^2$  assumed **Gaussian**

- NH:  $(2.47 \pm 0.06) \times 10^{-3} \text{ eV}^2$
- IH:  $(-2.34 \pm 0.06) \times 10^{-3} \text{ eV}^2$

✓ Likelihood

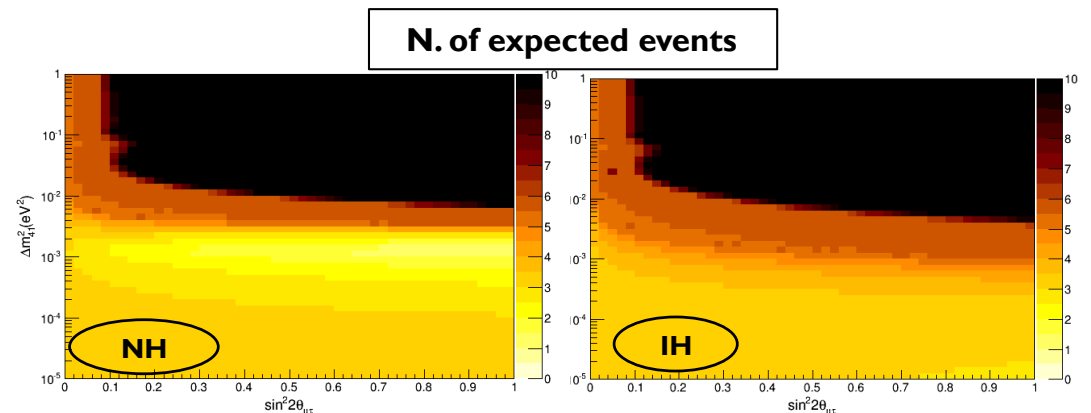

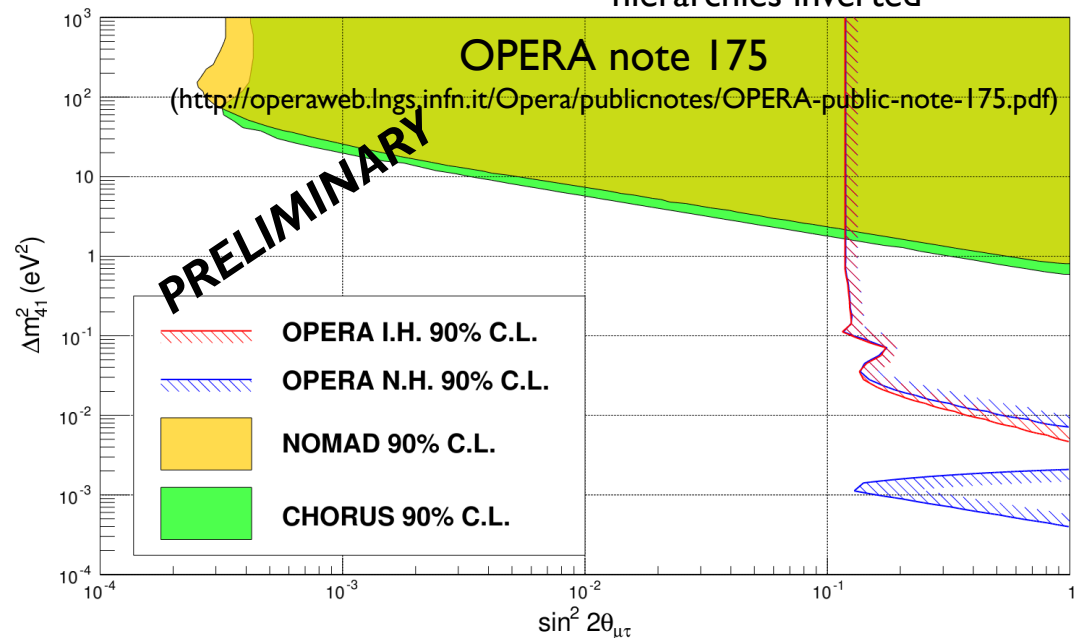

$$L = \text{Poisson}(n|\mu) \times \text{Gaus}(\Delta m_{31}^2)$$

✓ Test statistic:

**profile likelihood ratio**

✓ Not interesting parameters profiled out

$\Delta m_{41}^2 < 0$  (disfavoured by cosmological limits on  $\Sigma m_\nu$ ) gives similar results with hierarchies inverted

# New results

5  $\nu_\tau$  candidates

At Long-Baseline and high  $\Delta m^2_{41}$   
(eV scale mass):

$$\begin{aligned} \sin \Delta_{41} &\approx 0 \\ \sin^2 \frac{\Delta_{41}}{2} &\approx \frac{1}{2} \end{aligned}$$

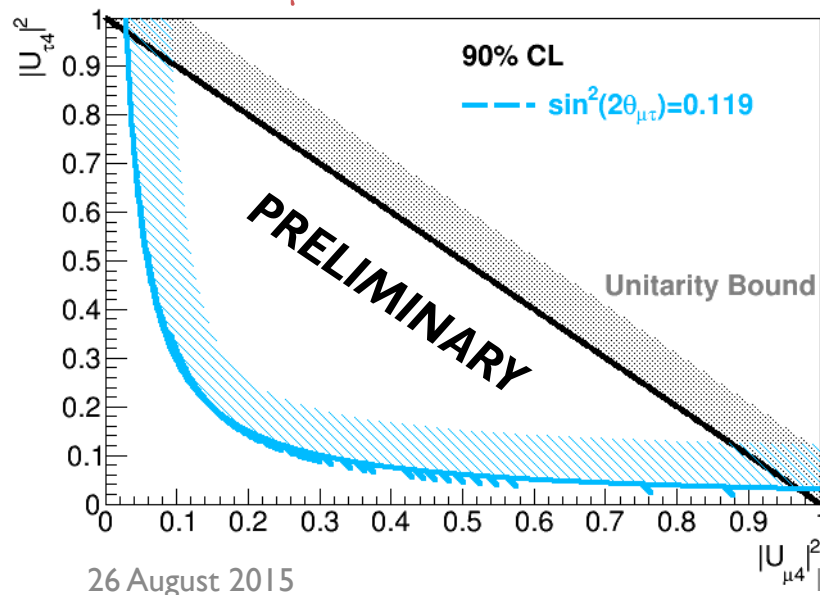

$$\begin{aligned} P(\text{Energy}) &= C^2 \sin^2 \frac{\Delta_{31}}{2} + \frac{1}{2} \sin^2 2\theta_{\mu\tau} \\ &+ C \sin 2\theta_{\mu\tau} \cos \phi_{\mu\tau} \sin^2 \frac{\Delta_{31}}{2} \\ &+ \frac{1}{2} C \sin 2\theta_{\mu\tau} \sin \phi_{\mu\tau} \sin \Delta_{31} \end{aligned}$$

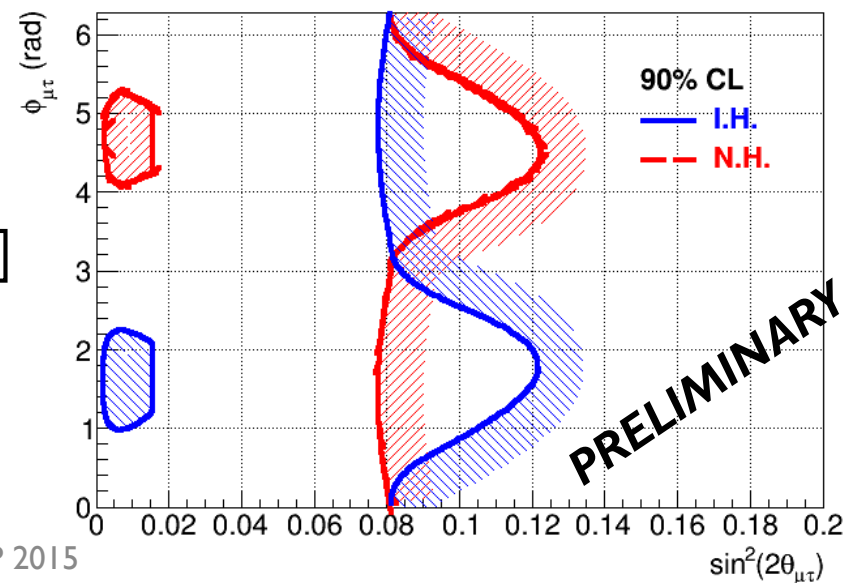

Profiling out  $\phi_{\mu\tau}$

$\sin^2 2\theta_{\mu\tau} < 0.119$  at 90% C.L.

Profiling out C and fixing  $\Delta m^2_{31}$   
to the PDG 2014 best fit value

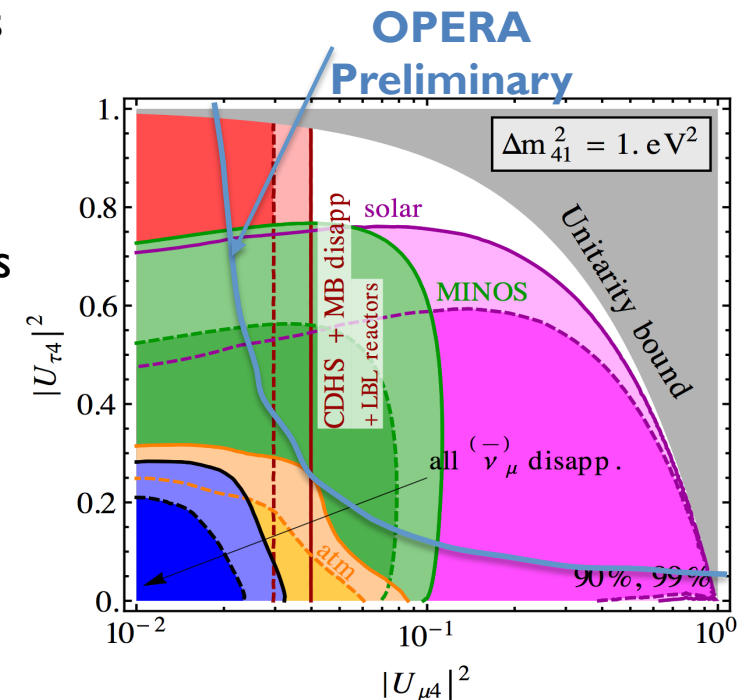

# Conclusions

- OPERA was designed to observe  $\nu_\mu \rightarrow \nu_\tau$  **oscillations** in **appearance mode** in the atmospheric sector
  - Currently **5  $\nu_\tau$  event candidates** were identified with a background expectation of 0.25 events  $\rightarrow$   **$5\sigma$**  discovery of tau neutrino appearance!

- The sterile mixing at eV mass scale can be studied also at Long-Baseline  $\nu_\mu$  beams
  - OPERA sterile search in appearance mode provides a **complementary measurement** w.r.t. disappearance experiments

- 3+1 sterile neutrino working hypothesis
  - $\rightarrow$  derived exclusion regions for oscillation parameters

- 90% C.L. exclusion region on  $\Delta m_{41}^2$  lowered down to  $10^{-2} \text{ eV}^2$  for  $\sin^2 2\theta_{\mu\tau} > 0.5$
- At large  $\Delta m_{41}^2$ :  $\sin^2 2\theta_{\mu\tau} < 0.119$  at 90% C.L.

Thank you for your attention!

# Published Results

4  $\nu_\tau$  candidates

Results based on 4 taus' candidates published in JHEP 06 (2015) 069

For  $|\Delta m_{41}^2| > 1 \text{ eV}^2$

$$\sin^2 2\theta_{\mu\tau} < 0.116 \text{ at 90\% C.L.}$$

when integrating over  $\phi$   
(quasi-equal results for NH and IH)

Results given in terms of an **effective mixing parameter**

$$\sin^2 2\theta_{\mu\tau} = 4 |U_{\mu 4}|^2 |U_{\tau 4}|^2$$

which is the leading mixing term at short baseline experiments
