Contents

- 1. Introduction
 - Wind power market
 - SUPRAPOWER project

- 2. Modular cryostat description
 - Modular concept
 - Cooling source
 - Support structures

- 3. Thermal analysis of modular cryostat
 - Heat loads
 - Temperature distribution

- 4. Summary

Offshore Wind

Market Perspectives

	2020	2030	2050
Europe	40 GW	150 GW	460 GW
World	100 GW	375 GW	1150 GW
Cost per MW	4,5 M€	3,5 M€	2,5 M€

	2020	2030	2050
Europe	180,000 M€	565,000 M€	1.34 B€
World	450,000 M€	1.412 B€	3.35 B€

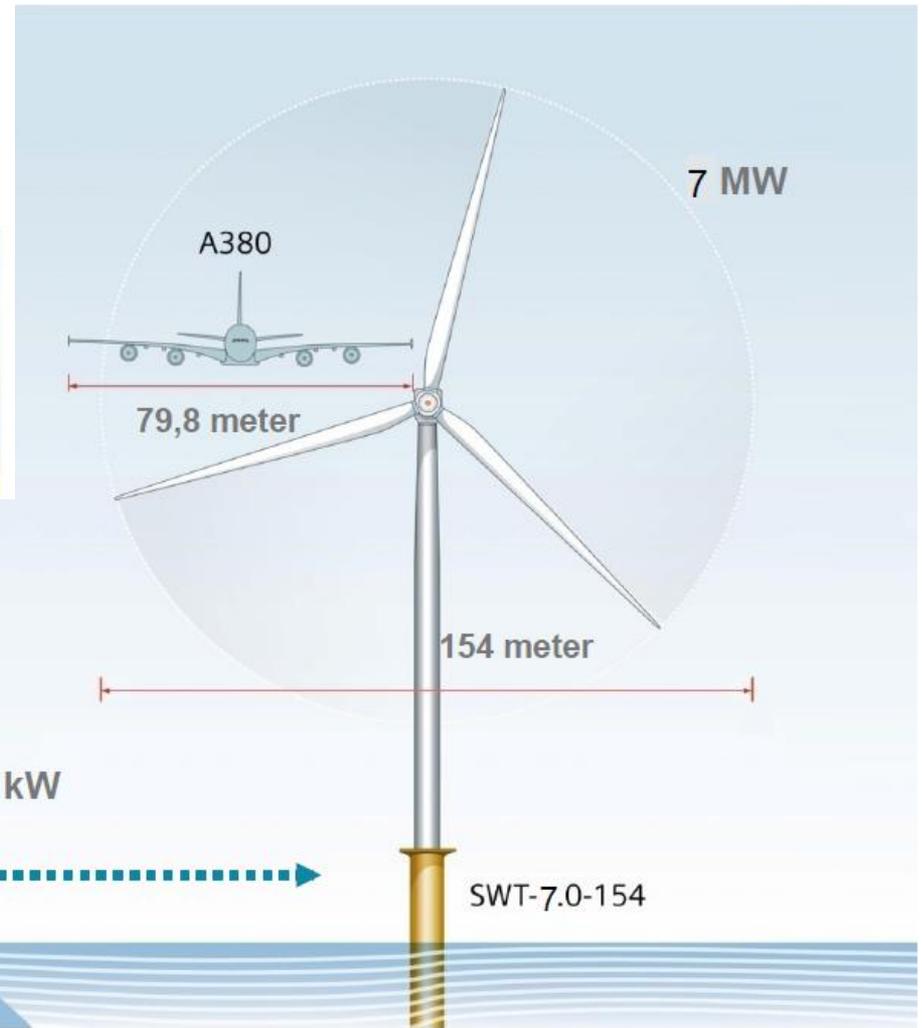

Source: EWEA and IEA

1M€=10⁶€

1B€=10¹²€

Huge offshore wind market is expected for the upcoming years.
Cost reductions are highly required to reach these predictions.

Wind Turbine Dimension

Source: Siemens & Gamesa at Bilbao Marine Energy Week, 2015

Offshore wind power market shows the tendency of large-scale wind turbines

Large-scale wind turbines

8MW

8MW

Large-scale conventional wind turbines are under development in the market

6MW

6 - 7 MW

How to develop large-scale wind turbines up to 10 MW and even 20 MW?

SUPARPOWER Project

Aims:

- Suprapower aims to develop a new concept of innovative, **lightweight, robust and reliable wind turbine for offshore applications** by use of superconductivity
- **10 MW class generator**. Objective: 30% weight and size reduction
- Validation of generator concept through **a scale machine**

Contents

- 1. Introduction
 - Wind power market
 - SUPRAPOWER project

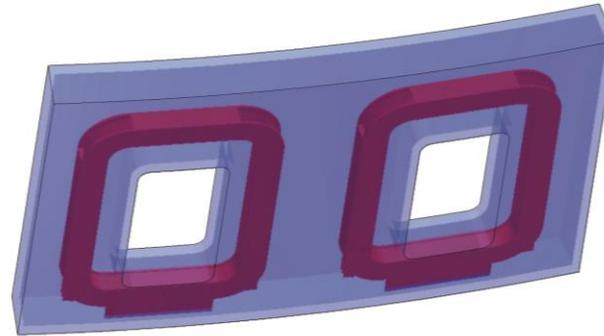

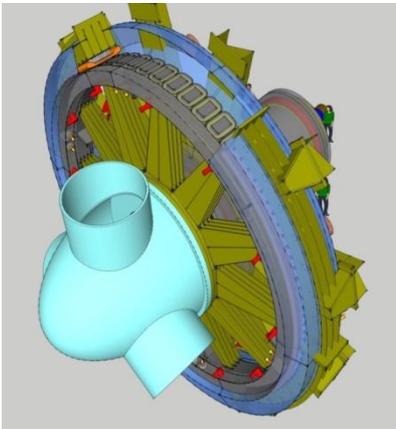

- 2. Modular cryostat description
 - Modular concept
 - Cooling source
 - Support structures

- 3. Thermal analysis of modular cryostat
 - Heat loads
 - Temperature distribution

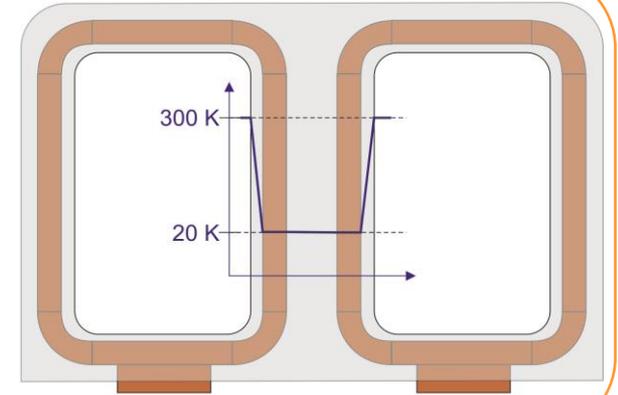

- 4. Summary

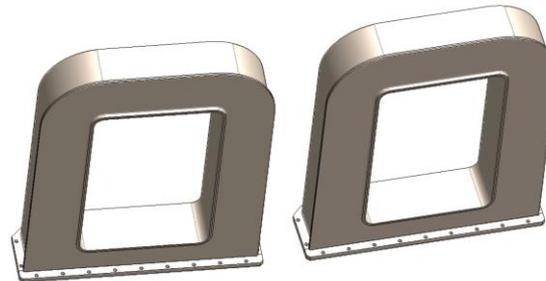

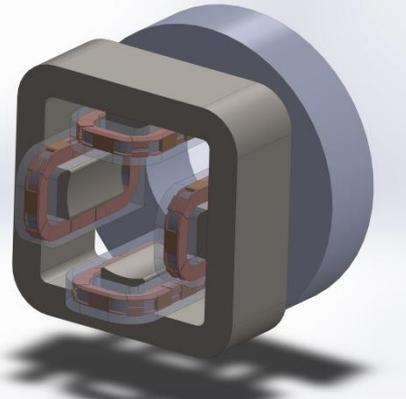

Modular concept

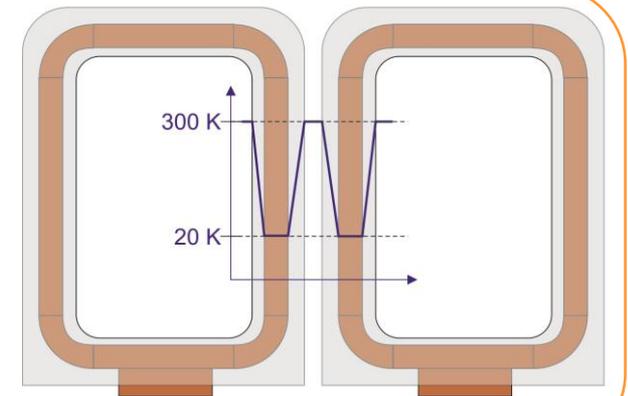

one cryostat for several coils

Source: TECNALIA

one cryostat for one coil

Modular cryostat are proposed to ease installation and maintenance

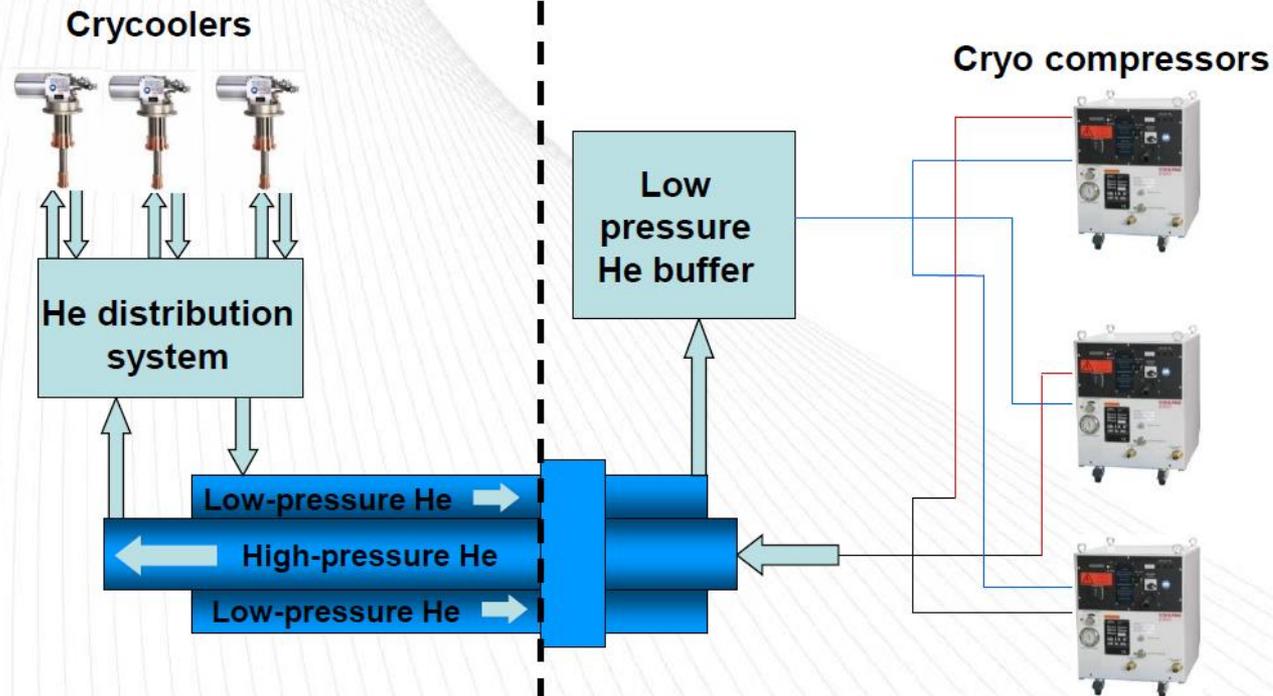

Cooling source-Cryocooler

Rotating part

Cold heads rotate with the rotor

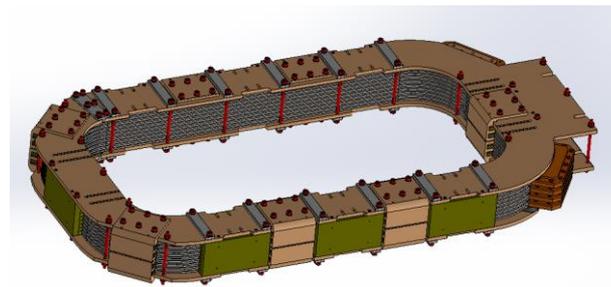

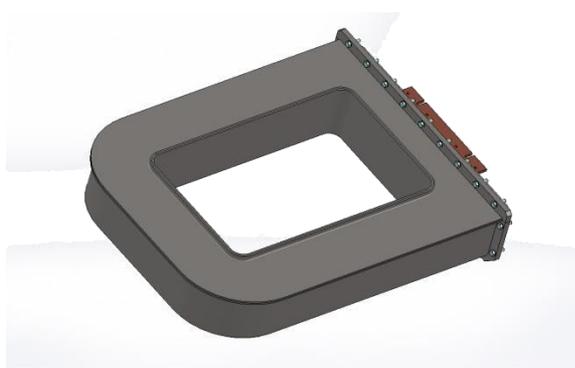

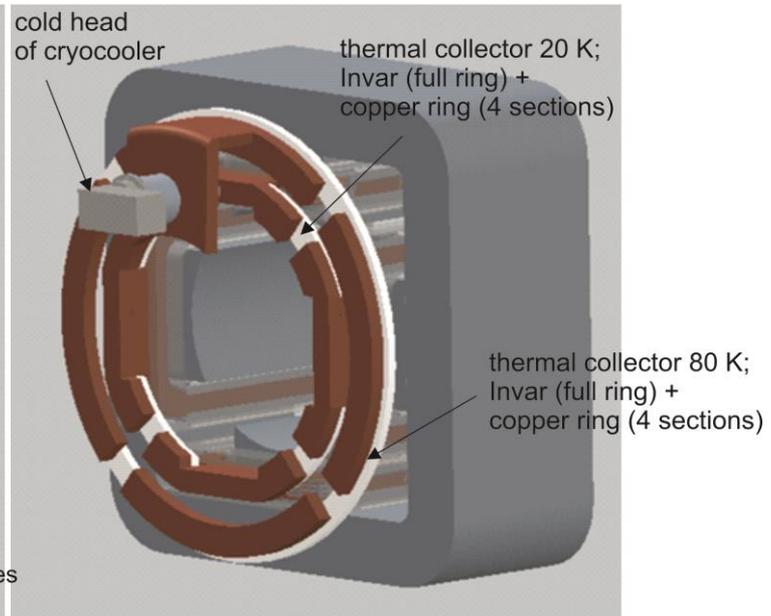

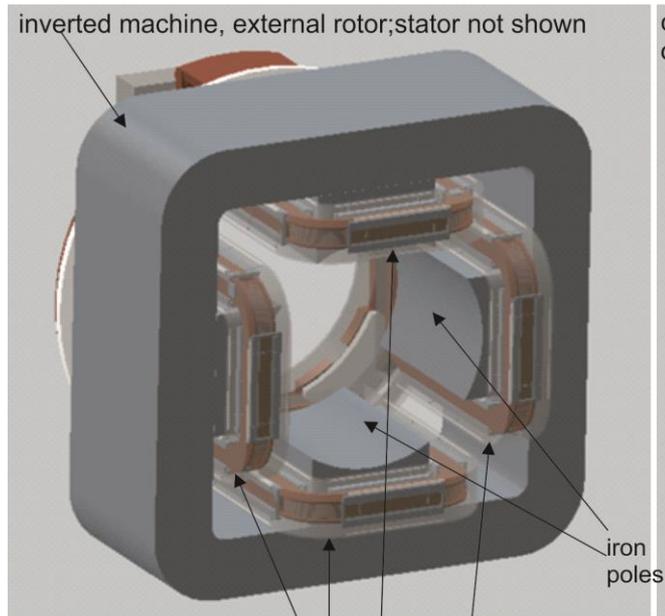

Stationary part

He compressors

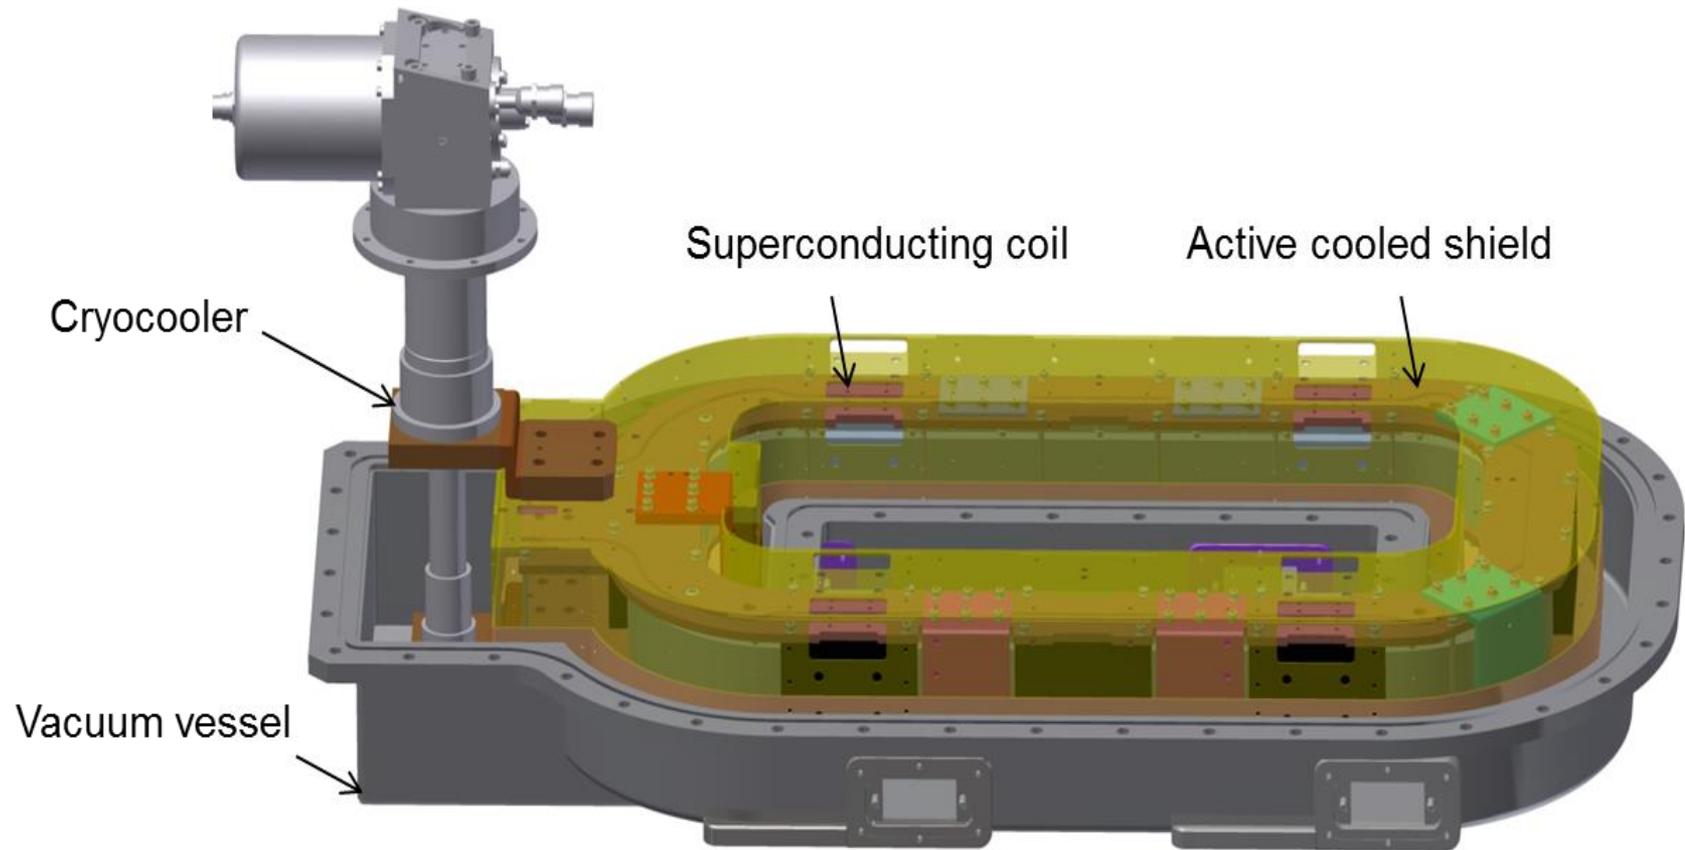

Rotary joint is required to connect the He compressor to the cold head

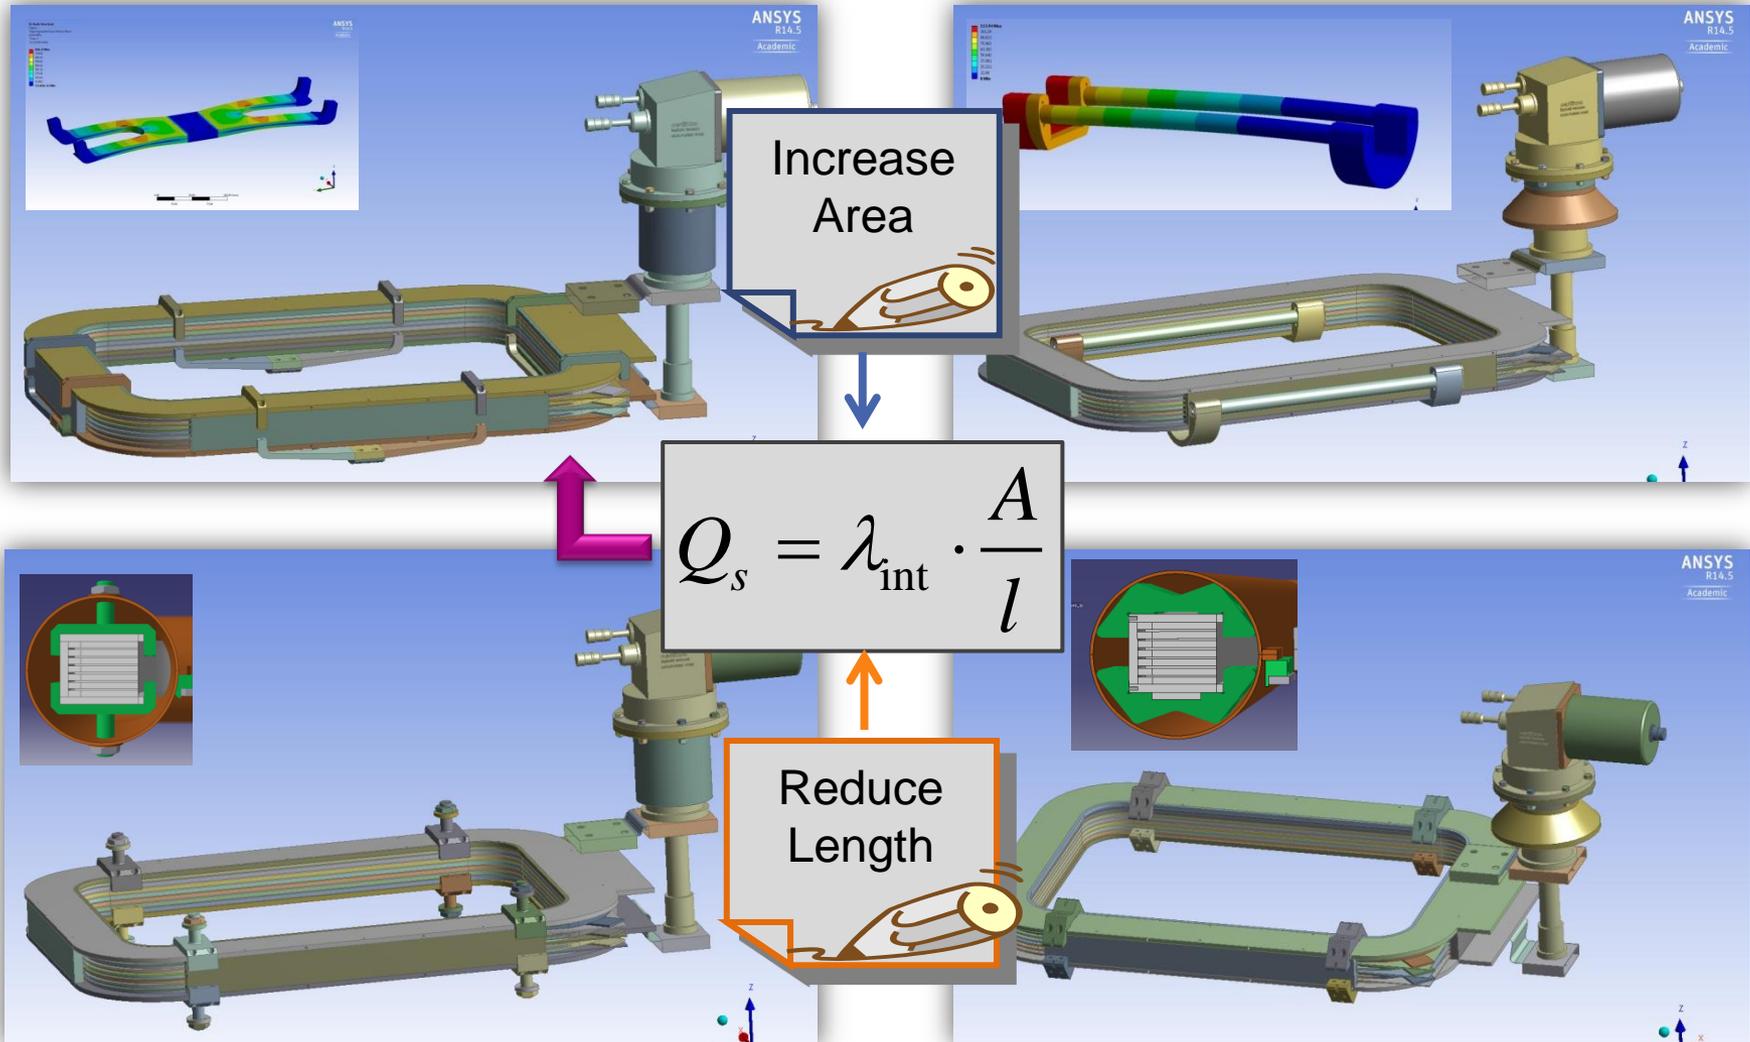

Modular cryostat

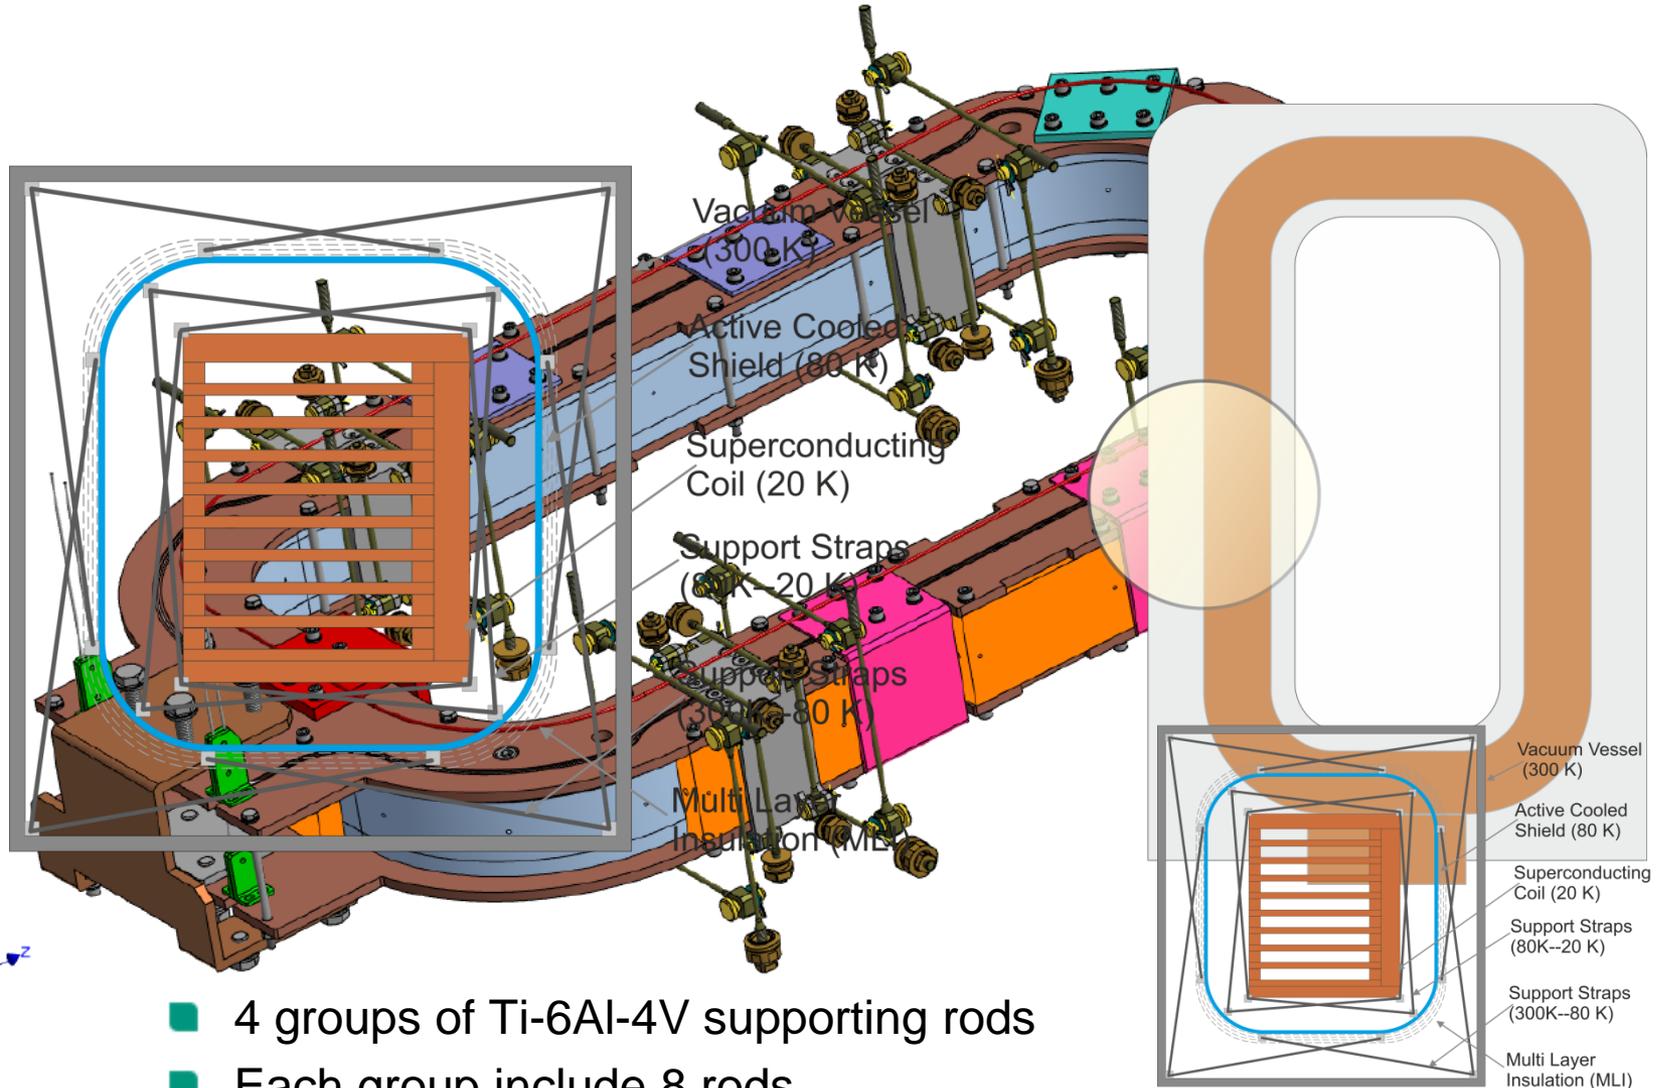

Modular cryostat

Conceptual design of support structure

Support structures

- 4 groups of Ti-6Al-4V supporting rods
- Each group include 8 rods

Contents

- 1. Introduction
 - Wind power market
 - SUPRAPOWER project

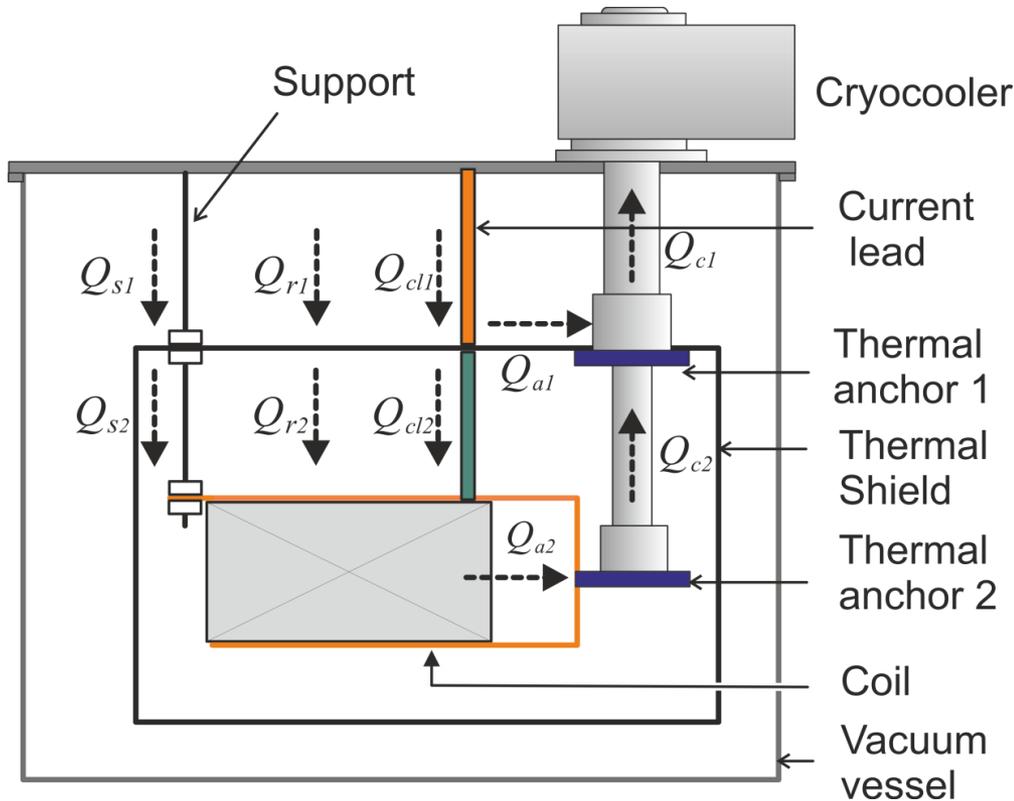

- 2. Modular cryostat description
 - Modular concept
 - Cooling source
 - Support structures

- 3. Thermal analysis of modular cryostat
 - Heat loads
 - Temperature distribution

- 4. Summary

Thermal analysis- Analytical model

- Steady state
- Zero dimension
- Neglect thermal anchor

$$\frac{d}{dt} (\rho V c_p T)_S = Q_H - Q_L - Q_{A_1}$$

$$\frac{d}{dt} (\rho V c_p T)_{SC} = Q_L - Q_{A_2}$$

$$\frac{d}{dt} (\rho V c_p T)_{A_1} = Q_{A_1} - Q_{C_1}$$

$$\frac{d}{dt} (\rho V c_p T)_{A_2} = Q_{A_2} - Q_{C_2}$$

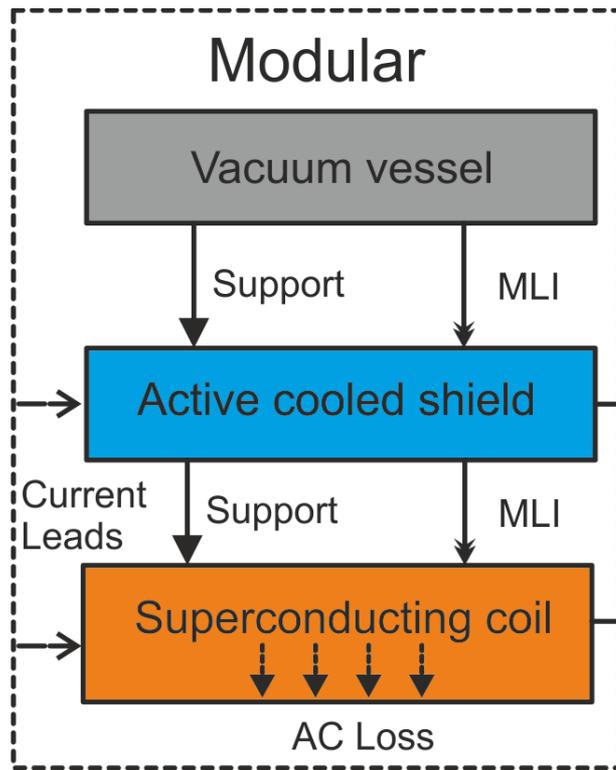

$$0 = Q_H - Q_L - Q_{c_1}$$

$$0 = Q_L - Q_{c_2}$$

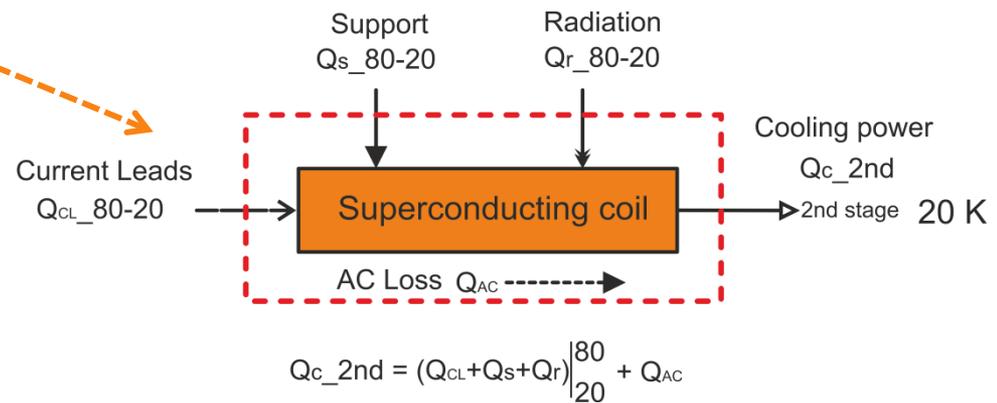

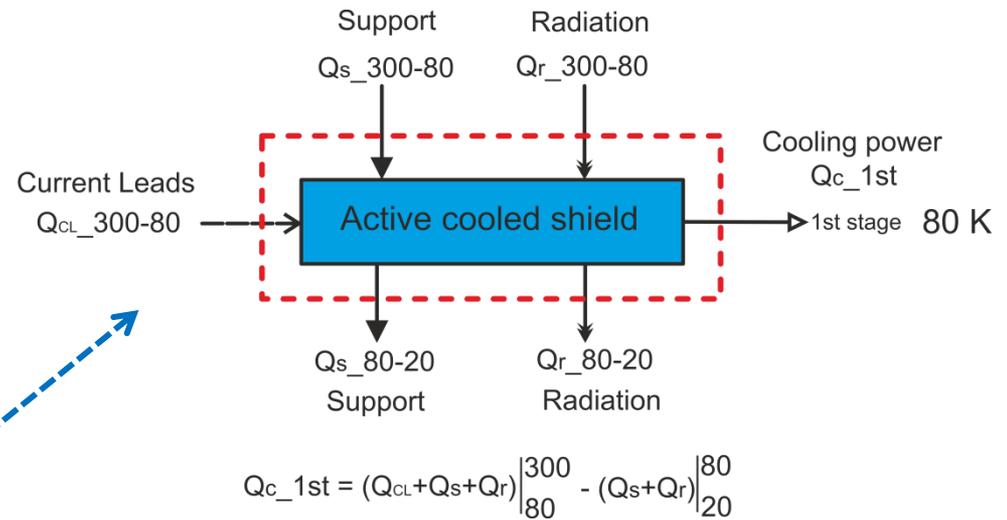

$$Q_H = Q_{s1} + Q_{r1} + Q_{cl1}$$

$$Q_L = Q_{s2} + Q_{r2} + Q_{cl2} + Q_{AC}$$

First law of thermodynamics

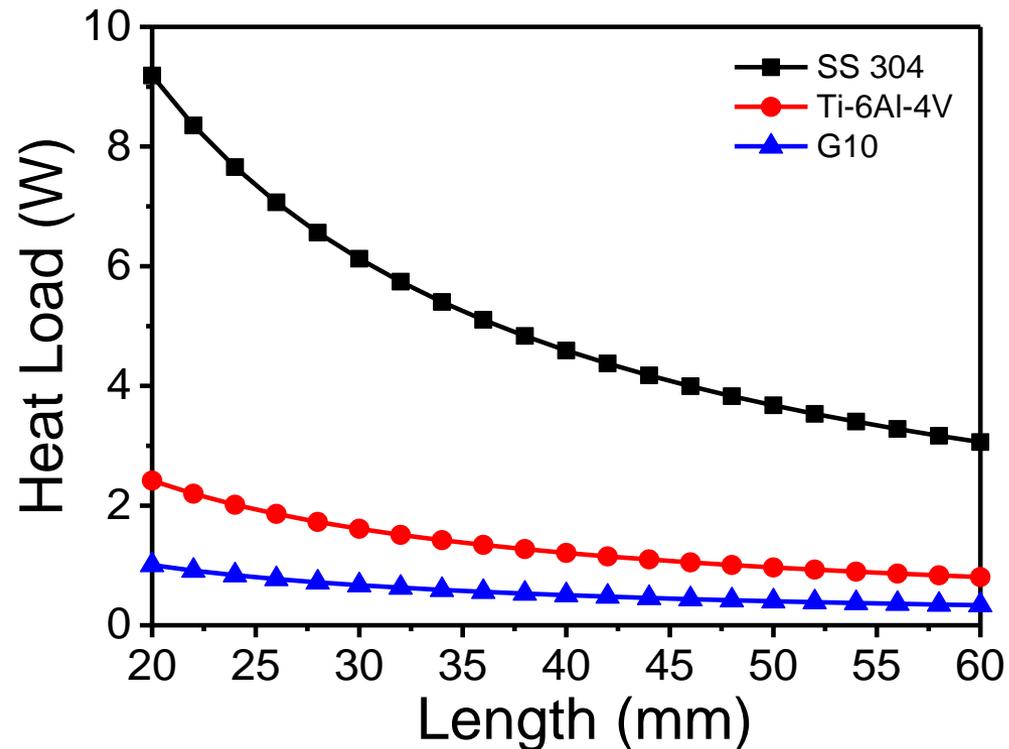

Heat load

Conduction via support-Material selection

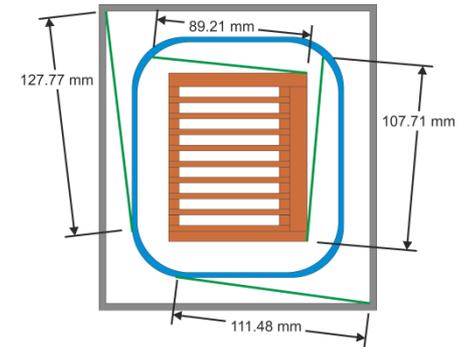

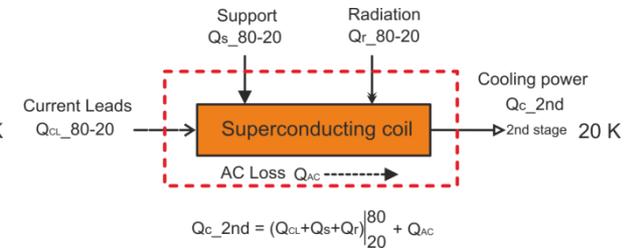

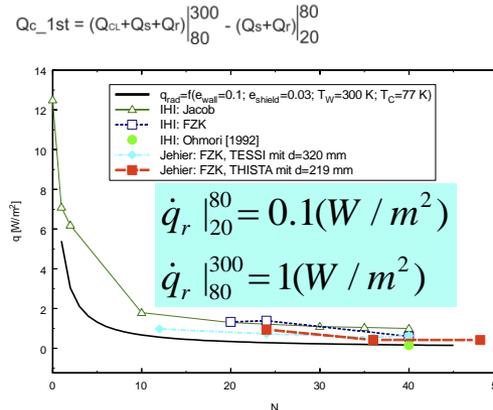

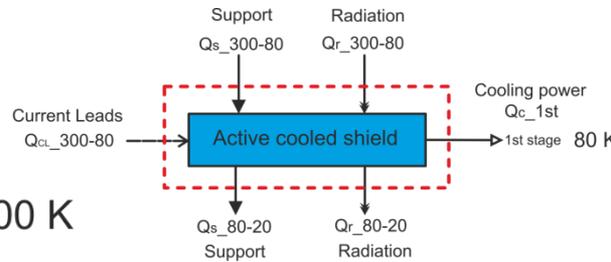

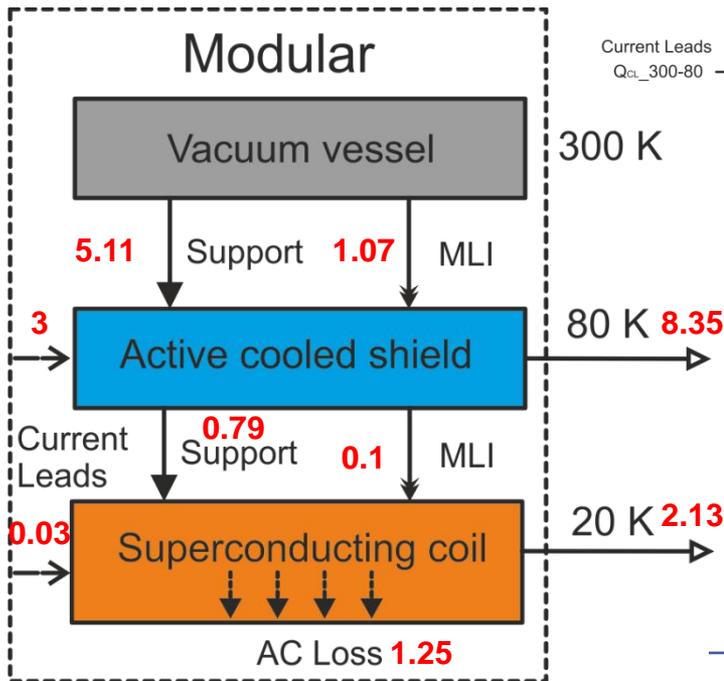

$$A_{strap} = \frac{F_{strap} \cdot s}{\sigma}$$

$$Q_{strap} = \lambda_{int} \frac{A_{strap}}{l} \cdot n$$

- The material G10 has the best thermal performance---lowest conduction
- G10 also has the largest cross sectional area & gas exhausting effect
- Titanium alloy Ti-6Al-4V is finally chosen for the cryostat straps

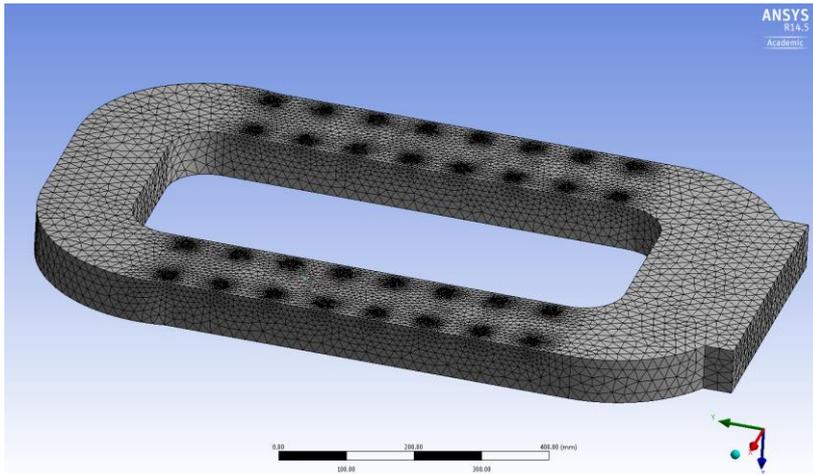

Heat load calculation

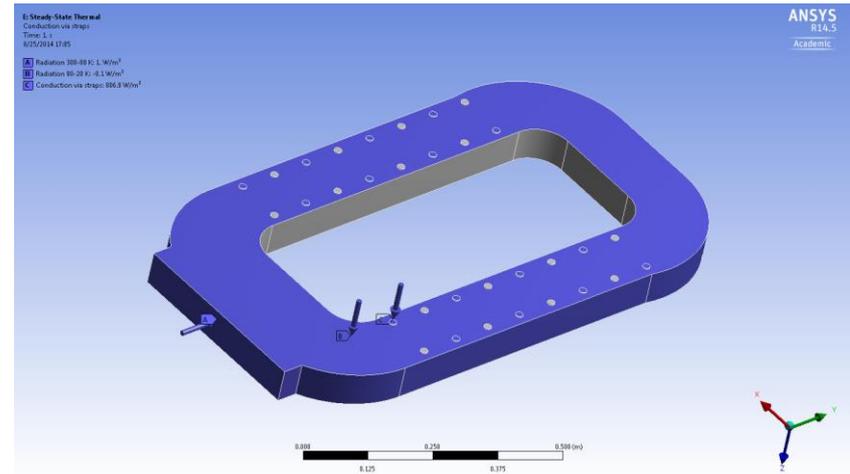

Assumption
Uniform temperature
 coil(20 K) shield(80 K)
 vessel(300 K)

Heat	Q_s	Q_r	Q_{Ac}	Q_{CL}	Sum
unit	W	W	W	W	W
Shield	5.11	1.07	0	3	8.26
Coil	0.79	0.1	1.25	0.03	2.17

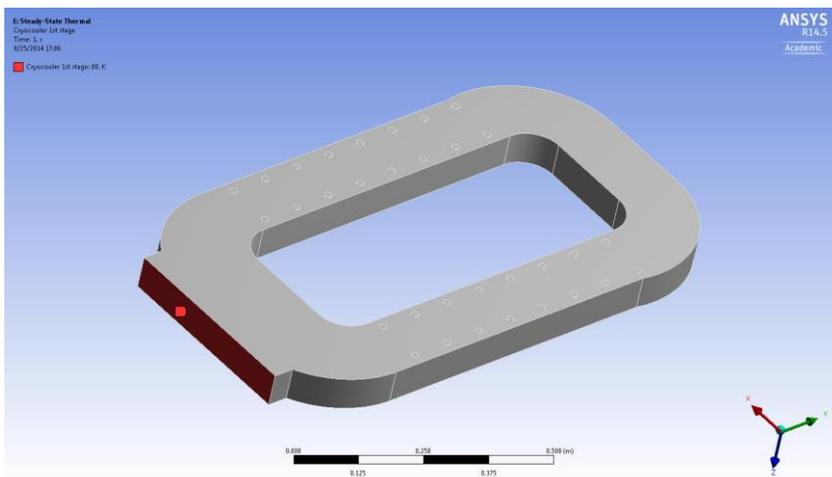

Design of active cooled shield- FEM simulation

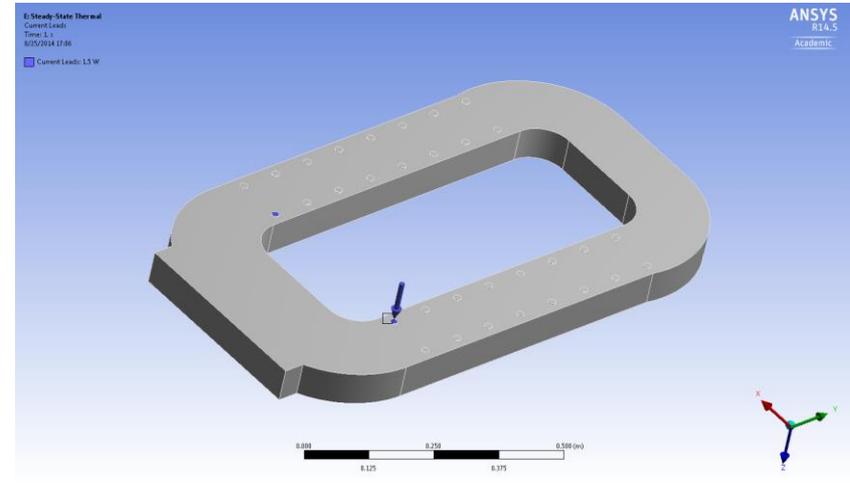

72,201 Elements and 140,040 Nodes

Conduction and radiation to shield

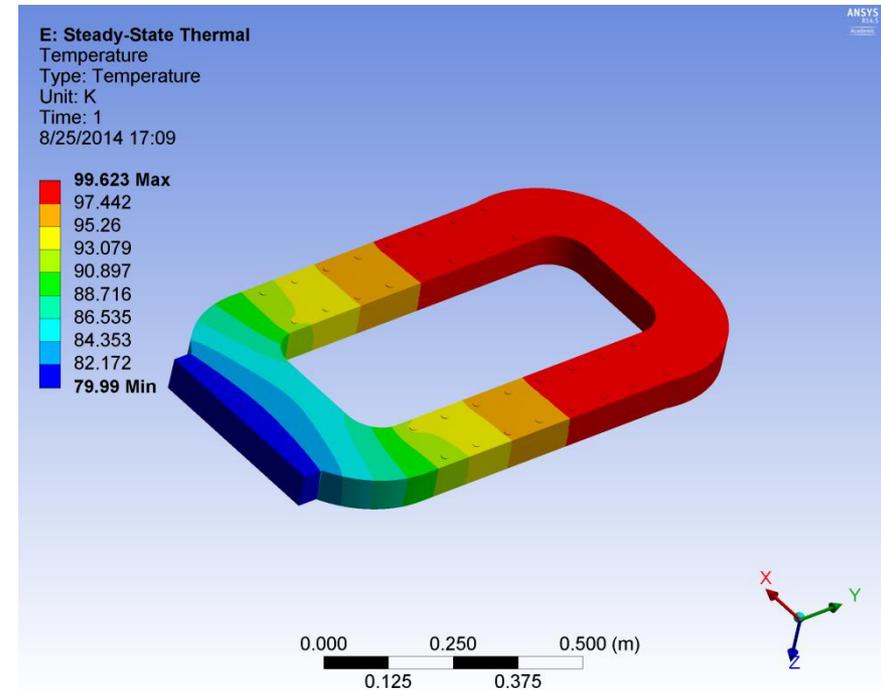

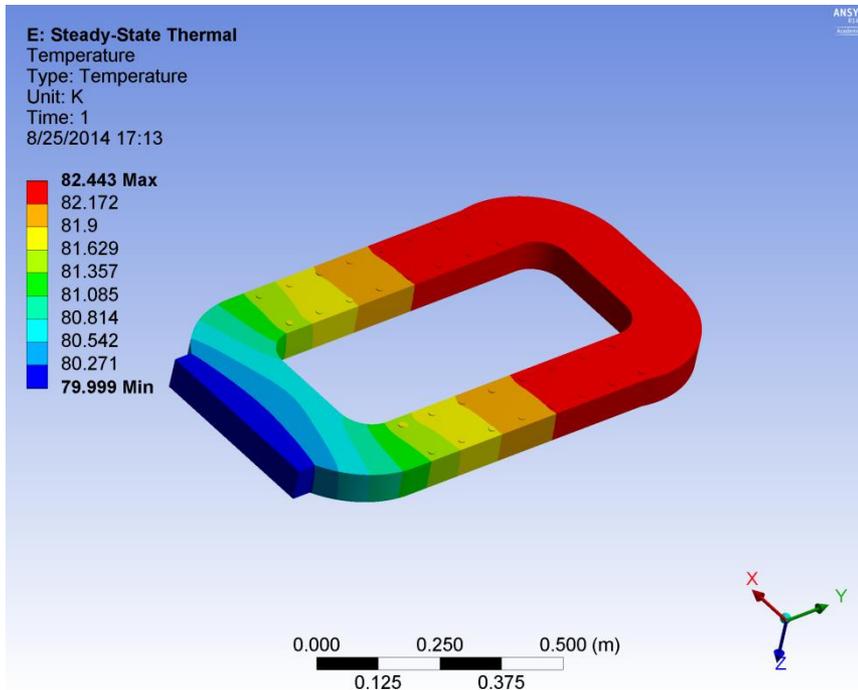

Cold end-Connect with cryocooler

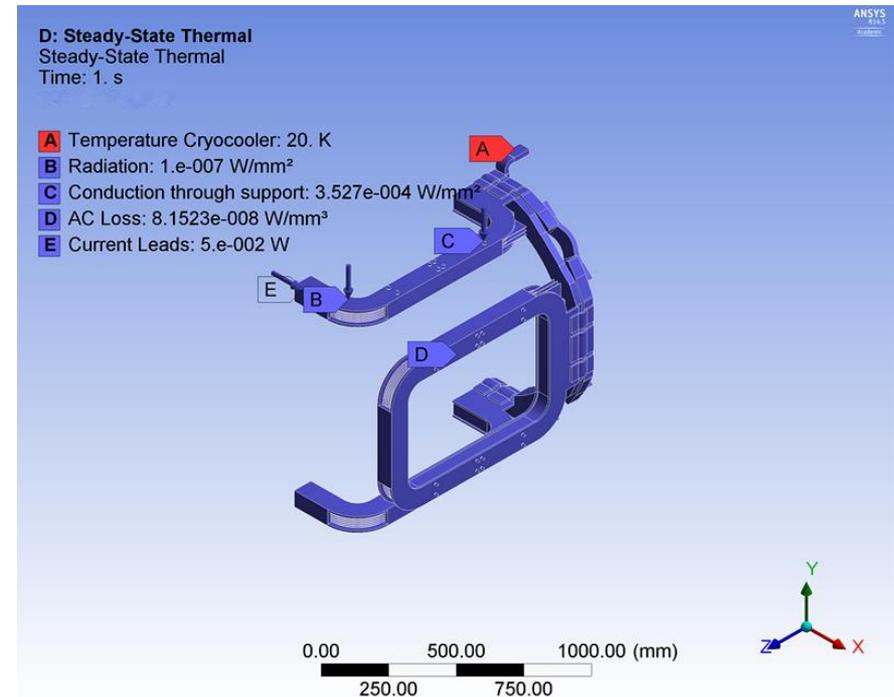

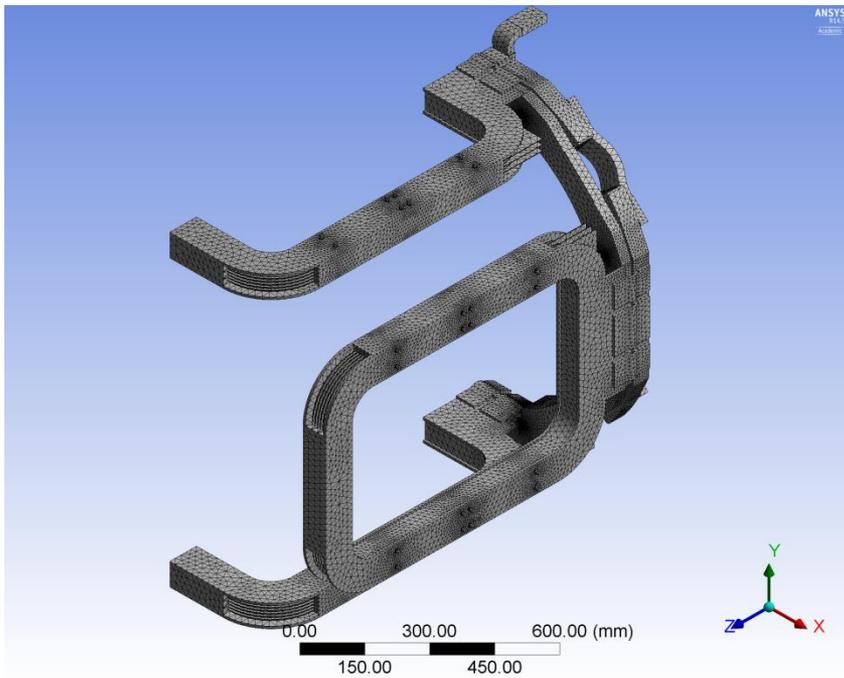

Current leads loss

Design of active cooled shield

- The temperature distribution of active cooled shield is not uniform
- The maximum temperature difference is 2.44 K and 19.62 K for copper and Al respectively
- Temperature change will influence the heat conduction on support straps

Ansys-numerical model

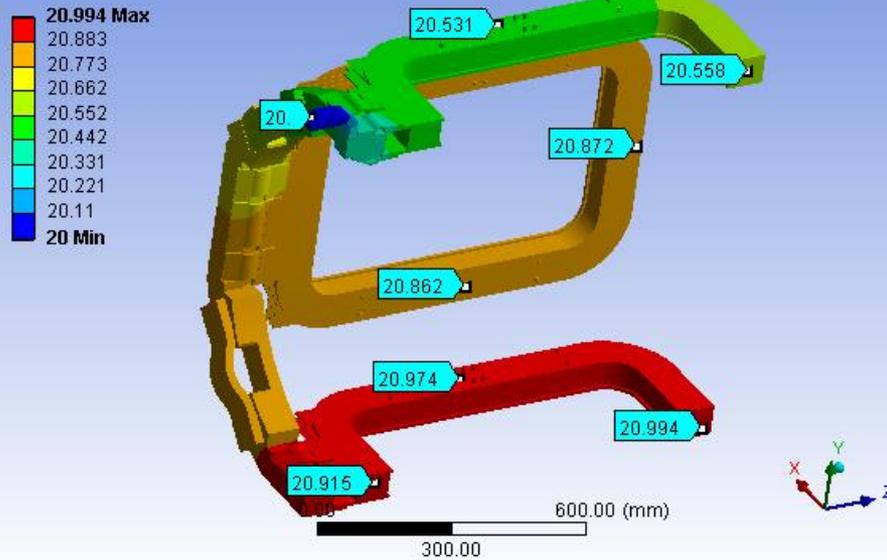

- The grid resolution gives a mesh with tetrahedral elements, resulting a total of 4,839,088 nodes and 3,511,053 elements.
- Because of the symmetry boundary condition only the half structure has been studied.
- Different heat loads are applied to the model accordingly

Temperature distribution

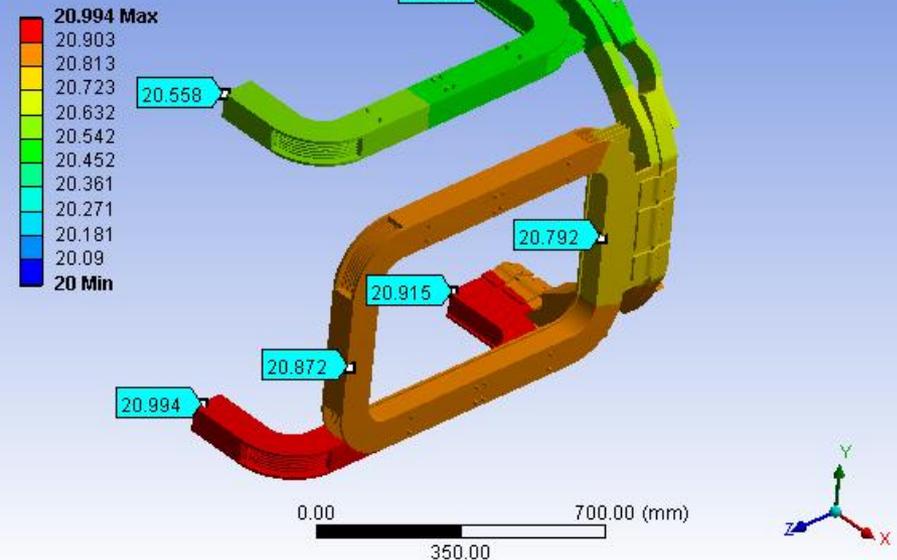

D: Steady-State Thermal
Temperature 2
Type: Temperature
Unit: K
Time: 1

ANSYS
R14.5
Academic

D: Steady-State Thermal
Temperature
Type: Temperature
Unit: K
Time: 1

ANSYS
R14.5
Academic

- The maximum temperature difference along the coil is around 1 K
- Reducing AC loss could further reduce this temperature variation

Contents

- 1. Introduction
 - Wind power market
 - SUPRAPOWER project

- 2. Modular cryostat description
 - Modular concept
 - Cooling source
 - Support structures

- 3. Thermal analysis of modular cryostat
 - Heat loads
 - Temperature distribution

- 4. Summary

Summary

- 1. Superconducting 10 MW offshore wind turbine
 - SUPRAPOWER project
 - MgB₂ superconducting wires

- 2. Modular cryostat concept
 - Modular cryostat
 - Two stage G-M cryocooler & Conduction cooling
 - Titanium alloy supporting rods

- 3. Thermal performance of cryostat
 - 2.17 W @ 20 K heat load per superconducting coil
 - 1 K temperature variation along the superconducting coil
