## Neutrino point source search including cascade events with the ANTARES neutrino telescope

Tino Michael
National Institute for Subatomic Physics, Amsterdam
on behalf of the ANTARES collaboration

34th International Cosmic Ray Conference den Haag, The Netherlands 2015-08-03

## Previous Sensitivities

## Status Quo:

- even though much smaller than IceCube, ANTARES provides best sensitivities for lower declinations
- ANTARES dominates southern hemisphere below 100 TeV (where most galactic signal is expected)
- best sensitivities so far:
$E^{2} \Phi_{\nu} \approx 1.4 \mathrm{GeVcm}^{-2} \mathrm{~s}^{-1}$ and slowly rising for higher declinations

## Cosmic Neutrinos discovered by IceCube

- most of the events have resolution $>10^{\circ} \rightarrow$ sources unknown!
- flux is large and extends to PeV energies
- possible point source around Galactic Centre has been largely constrained
$\rightarrow$ Poster by Javier B. Martí (636)

## Motivation

- up to now, muon candidates backbone of most ANTARES analyses
- clean signature and very well reconstructible (median resolution $\approx 0.4^{\circ}$ )
- limits us to $\nu_{\mu} \rightarrow \mu$ (and $\nu_{\tau} \rightarrow \tau \rightarrow \mu$ ) interactions
- shower events open window to

$$
\begin{aligned}
& \nu_{e} \rightarrow e \\
& \nu_{x} \rightarrow \text { hadr. } \\
& \nu_{\tau} \rightarrow \tau \rightarrow e / \text { hadr. }
\end{aligned}
$$

- have lower angular resolution but still valuable because of much lower background
- developed a cascade reconstruction algorithm with focus on pointing accuracy

## Reconstruction - Event Topology

## Muons:

- can pass through detector
- Cherenkov radiation along track
- photons emitted at $\varphi_{\mathrm{Ch}} \approx 42^{\circ}$

## Showers:

- cascade of particles within few metres
- can be approximated as point source
- emits shell of light in all directions
- still, more light emitted under "Cherenkov angle"

## Reconstruction - Event Topology

## Muons:

- can pass through detector
- Cherenkov radiation along track
- photons emitted at $\varphi_{\mathrm{Ch}} \approx 42^{\circ}$

## Showers:

- cascade of particles within few metres
- can be approximated as point source
- emits shell of light in all directions
- still, more light emitted under "Cherenkov angle"

## Reconstruction - Event Topology

## Muons:

- can pass through detector
- Cherenkov radiation along track
- photons emitted at $\varphi_{\mathrm{Ch}} \approx 42^{\circ}$

## Showers:

- cascade of particles within few metres
- can be approximated as point source
- emits shell of light in all directions
- still, more light emitted under "Cherenkov angle"

## Reconstruction - Event Topology

## Muons:

- can pass through detector
- Cherenkov radiation along track
- photons emitted at $\varphi_{\mathrm{Ch}} \approx 42^{\circ}$

## Showers:

- cascade of particles within few metres
- can be approximated as point source
- emits shell of light in all directions
- still, more light emitted under "Cherenkov angle"

## Reconstruction - Event Topology

## Muons:

- can pass through detector
- Cherenkov radiation along track
- photons emitted at $\varphi_{\mathrm{Ch}} \approx 42^{\circ}$

## Showers:

- cascade of particles within few metres
- can be approximated as point source
- emits shell of light in all directions
- still, more light emitted under "Cherenkov angle"

## Reconstruction - Event Topology

## Muons:

- can pass through detector
- Cherenkov radiation along track
- photons emitted at $\varphi_{\mathrm{Ch}} \approx 42^{\circ}$

## Showers:

- cascade of particles within few metres
- can be approximated as point source
- emits shell of light in all directions
- still, more light emitted under "Cherenkov angle"

## Reconstruction - Event Topology

Muons:

- can pass through detector
- Cherenkov radiation along track
- photons emitted at $\varphi_{\mathrm{Ch}} \approx 42^{\circ}$

Showers:

- cascade of particles within few metres
- can be approximated as point source
- emits shell of light in all directions
- still, more light emitted under "Cherenkov angle"

expected number of Photons from a 1 TeV shower on a PMT 100 m from the shower

## Reconstruction - Likelihood Function

- Likelihood depends on neutrino energy, direction, distance to OM, incident angle
- expected charge $q$ on a PMT described by tabulated PDF
- unhit PMTs and Background rate taken into account

$$
\begin{aligned}
\mathscr{L}= & \sum_{i=1}^{N_{\text {selected Hits }}} \log \left\{P_{q>0}\left(q_{i} \mid E_{\nu}, d_{i}, \phi_{i}, \alpha_{i}\right)+P_{\mathrm{bg}}\left(q_{i}\right)\right\} \\
& +\sum_{i=1}^{N_{\text {unhit PMTs }}} \log \left\{P_{q=0}\left(E_{\nu}, d_{i}, \phi_{i}\right)\right\}
\end{aligned}
$$

## Reconstruction - Performance: Direction \& Energy

- position of shower mean reconstructed with accuracy of about 1 m
- median angular error $\xi \approx 3^{\circ}$ in relevant energy range
- systematic offset in energy of $20 \%$ easily corrected
- energy resolution of $5 \%$

## Reconstruction - Direction Resolution directly from Data

- resolution can be measured on muon-induced showers
- comparing directions as reconstructed by track and shower algorithm (we trust the reconstructed muon direction)
- reconstructed track direction depends only on timing, shower direction only on charge
- shows clear peak at low angles
- confirms angular resolution of $2-3^{\circ}$ as found in MC

## Reconstruction - Direction Resolution directly from Data

- resolution can be measured on muon-induced showers
- comparing directions as reconstructed by track and shower algorithm (we trust the reconstructed muon direction)
- reconstructed track direction depends only on timing, shower direction only on charge
- shows clear peak at low angles
- confirms angular resolution of $2-3^{\circ}$ as found in MC

## Event Selection

## Showers:

lots of cuts to suppress atm. muons - i.a.:

- containment $\rho<300 \mathrm{~m}$
- angular error estimate $<10^{\circ}$
- up-going: $\cos (\vartheta)>-0.1$

## Muons:

same cuts as in last analysis

- quality parameter $\Lambda>-5.2$
- angular error estimate $<1^{\circ}$
- up-going: $\cos (\vartheta)>-0.1$
- ratio between charge of early and on-time hits

## Data Set

- 1622 days from 2007 to the end of 2013 ( 185 days of 5-line data not included in shower channel)
- contains 6261 muon track candidates and 156 cascade events ( $90 \%$ purity)
- $\nu_{\tau} \rightarrow \tau \rightarrow \mu / e / h a d r$. are taken into account by scaling up $\nu_{\mu} \rightarrow \mu$ and $\nu_{e} \rightarrow e$ with respective $\tau$ branching ratios
- for $E^{-2}$ flux with 1:1:1 flavour composition, shower channel increases signal event rate by $30 \%$

Figure : signal acceptance for Left: the track channel and Right: the shower channel

## Point Source Search

- signature of a point source is cluster of events
- distribution of signal around source described by Point-Spread-Function (PSF)
- background rate considered as function of declination
- number of selected hits to further separate between atmospheric background and cosmic signal
- sum over tracks and showers in reasonably large area around hypothesized source

$$
\begin{gathered}
\log \mathscr{L}_{\mathrm{s}+\mathrm{b}}=\sum_{i} \log \left[\mu_{\mathrm{sig}} \times \mathscr{F}\left(\gamma_{i}\right) \times \mathscr{N}_{\text {sig }}\left(N_{\mathrm{i}}^{\text {Hits }}\right)+\mathscr{B}\left(\delta_{\mathrm{i}}\right) \times \mathscr{N}_{\text {backg }}\left(N_{\mathrm{i}}^{\text {Hits }}\right)\right]-\mu_{\text {sig }} \\
Q=\log \mathscr{L}_{\mathrm{s}+\mathrm{b}}-\log \mathscr{L}_{\mathrm{b}}
\end{gathered}
$$

| $\mathscr{F}:$ Point-Spread-Function | $\gamma$ : angle between event and source |
| :--- | :--- |
| $\mathscr{B}:$ background rate | $\delta:$ declination |

$\mathscr{N}:$ Number of Hits distribution for Signal / Background
$Q:$ Test Statistics to differentiate between Signal and Background

## Ingredients

Figure : Top: $\mathscr{F}$ - Bottom: $\mathscr{B}$ - Left: muons - Right: showers

## Search Methods

- sensitivities determined with Pseudo Experiments
- background rate $(\mathscr{B})$ from data
- PSF ( $\mathscr{F}$ ) from Monte Carlo Simulation

Three different searches presented here:

- Full Sky search: fitting $\mu_{\text {sig }}, \alpha_{\text {sig }}$ and $\delta_{\text {sig }}$
- Fixed Point search: $\alpha$ and $\delta$ given by candidate list, fitting only $\mu_{\text {sig }}$
- IceCube HESE candidates: using direction from 8 IceCube tracks and trying to fit a cluster within $2^{\circ}$ cone

## most significant cluster in full sky search

- most significant cluster at similar position as in last analysis:
$\alpha=-48.3^{\circ}, \delta=-64.6^{\circ}$ old analysis (tracks only): $\alpha=-46^{\circ}, \delta=-65^{\circ}$
- 16 tracks within $3^{\circ}$,

1 shower within $10^{\circ}$

- $N_{\text {Sig }}=5.5+0.8$
(Tracks + Showers)
- significance: $1.33 \sigma$, p-value: 0.185
- old analysis (tracks only):

15 tracks within $3^{\circ}$
$N_{\text {Sig }}=6.7$
$2.17 \sigma$, p-value: 0.029

## Point Source Candidate List

## Sensitivity and Candidate Limits

sensitivity down to $1.0 \times 10^{-8} \mathrm{GeVcm}^{-2} \mathrm{~s}^{-1}$ and flat over broad declination range
showers improve sensitivities by about $30 \%$
world-best limits for many (galactic) candidate objects

## most significant source in fixed point search

- same source as in last analysis:

HESSJ0632+057
$\alpha_{\mathrm{s}}=98.24^{\circ}, \delta_{\mathrm{s}}=5.81^{\circ}$

- 36 tracks +0 showers within $10^{\circ}$
- $N_{\text {sig: }} 1.2+0.2$
(Tracks + Showers)
- significance: $0.75 \sigma$, p-value: 0.456
- old analysis (tracks only):
$N_{\text {Sig }}=1.51$
$1.64 \sigma$

## IceCube Candidate List

| IceCube ID | $\alpha_{\text {fit }} /{ }^{\circ}$ | $\delta_{\text {fit }} /{ }^{\circ}$ | $\beta_{\text {IC }} /{ }^{\circ}$ | $N_{\text {Events }}$ | $\sigma$ | $N_{\text {Signal }}$ (Tr.+Sh.) |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 28 | 164.8 | -71.5 | 1.3 | 7 | 0.0 | $0.0+0.0$ |
| 3 | 127.9 | -31.2 | 1.4 | 11 | 0.0 | $0.0+0.0$ |
| 8 | -177.6 | -21.2 | 1.3 | 9 | 0.0 | $0.0+0.0$ |
| 5 | 110.6 | -0.4 | 1.2 | 5 | 0.0 | $0.0+0.0$ |
| 18 | -14.4 | 24.8 | 1.3 | 5 | 0.0 | $0.0+0.0$ |

| 37 | 167.3 | 20.7 | 1.2 | 1 | 0.0 | $0.0+0.0$ |
| 13 | 67.9 | 40.3 | 1.2 | 1 | 0.0 | $0.0+0.0$ |

- IceCube Id: 28
- $\alpha_{\mathrm{IC}}=164.8^{\circ}, \delta_{\mathrm{IC}}=-71.5^{\circ}$, $\beta_{\mathrm{IC}}=1.3^{\circ}$
- 7 tracks within $3^{\circ}$, 0 showers within $10^{\circ}$
- $N_{\text {Sig }}: 0.0+0.0$ (Tracks + Showers)
- significance: $0 \sigma$

## Conclusion

- shower reconstruction algorithm for ANTARES has been developed
- achieves direction resolution of $3^{\circ}$ and energy resolution of $5 \%$
- $\rightarrow$ water allows pointing with showers
- applied to new point source search, combining tracks and showers
- included data from 2013 in new analysis
- performed three different search methods: full sky, fixed source candidate list, IceCube HESE candidate list
- no significant clusters have been found
- same most significant cluster in full sky search but with reduced significance: $p=18.5 \%$
- same most significant source (HESSJ0632+057) also with reduced significance: $p=45.6 \%$
- search for point sources near IC tracks shows no excess
- ANTARES provides world's best limits for several galactic sources

## Outlook

- extended sources
- different spectral indices
- write paper, write thesis
- shower reconstruction ready to be applied to any other analyses

## Backup

## longitudinal Emission Spectrum of em-Showers

Figure : longitudinal Profile of electromagnetic shower in water

## angular Emission Spectrum of em-Showers

Figure : Expected number of photons for a 1 TeV neutrino ( $\nu_{\mathrm{e}}$, charged current interaction) with dependence on the emission angle $\phi$ from the neutrino direction and the distance $d$ from the shower's position of mean intensity.

## Reconstruction - Performance: Position

Figure : Performance of the shower position reconstruction, red for electromagnetic showers, blue for hadronic showers, the purple line is the mean of the light emission spectrum for em-showers - Left: The distance between the position of the neutrino interaction vertex and the reconstructed shower position along the neutrino axis. Right: The distance of the reconstructed shower position perpendicular to the neutrino axis.

## Reconstruction - Performance: Direction \& Energy

Figure : Performance of the shower energy-direction reconstruction, red for electromagnetic showers, blue for hadronic showers - Left: The angle between the directions of the reconstructed shower and the Monte Carlo neutrino. Right: The ratio between the reconstructed energy and the Monte Carlo shower energy.

## Fit Performance

- injected signal can be reasonably well fitted
- the source position can be safely found when 4 or more events are injected

Figure : Pseudo experiments with various numbers of injected signal events Left: Fitted number of signal events in fixed point search - Right: Fitted right ascension in full sky search.

## Discovery Potential

Figure : probability to find a source with $3 / 5 \sigma$ depending on the number of signal events with the fixed point search.

## Discovery Potential

Figure : The flux necessary for a $50 \%$ probability for a $5 \sigma$ discovery in the Left: full sky and Right: fixed point search.
