

LHCb Computing

Computing for the
LHCb Upgrade

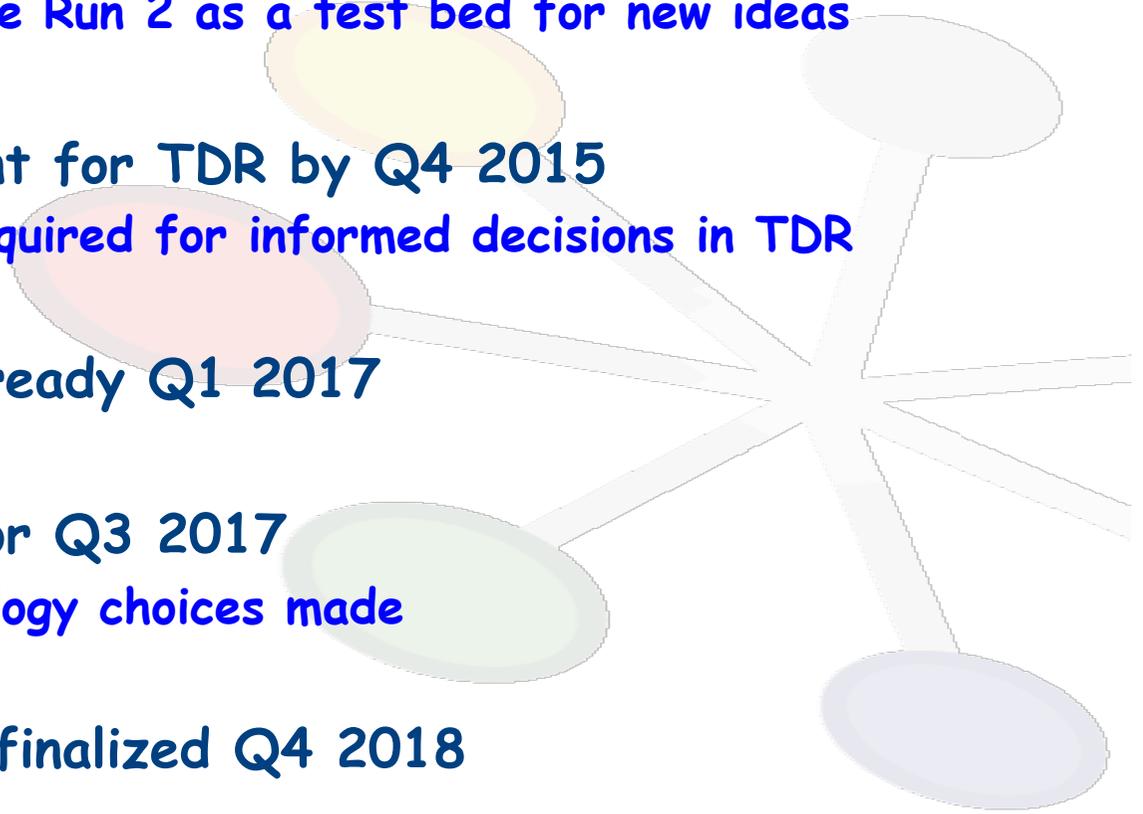

LHCb Upgrade: goal and timescale

- LHCb upgrade will be operational after LS2 (~2020)
- Increase significantly the statistics collected by the experiment, keeping the present excellent performance
 - Raise operational luminosity to a levelled $2 \times 10^{33} \text{ cm}^{-2}\text{s}^{-1}$
 - ☆ Necessitates redesign of several sub-detectors
 - ☆ Does not require HL-LHC
 - Full software trigger at 40 MHz bunch crossing rate
 - ☆ Allows effective operation at higher luminosity
 - ☆ Improved efficiency in hadronic modes
 - ☆ Necessitates upgrade of the DAQ and HLT
- The gain is a huge increase in precision, in many cases to the theoretical limit, and the ability to perform studies beyond the reach of the current experiment
 - Flexible trigger and unique acceptance also opens up opportunities for other topics apart from flavour

LHCb Upgrade Computing Timeline

- 2020 is tomorrow
 - No time (or effort) for major changes in technology
 - Focused R&D based on existing experience
 - Possibility to use Run 2 as a test bed for new ideas
- Roadmap document for TDR by Q4 2015
 - Specify R&D required for informed decisions in TDR
- All R&D reports ready Q1 2017
- TDR scheduled for Q3 2017
 - Baseline technology choices made
- Computing model finalized Q4 2018

Trigger at the upgrade

- Trigger-less readout at full LHC crossing rate
 - No hardware (L0) trigger
- First and second level software trigger (HLT1/2) running on Event Filter Farm
 - Full deferral as in Run 2
 - ☆ Offline quality detector calibration
- Event Size:
 - 100 KB maximum (constraint from readout system)
 - ☆ 10-20 times smaller for channels going to TURBO stream

LHCb Upgrade Trigger Diagram

**30 MHz inelastic event rate
(full rate event building)**

Software High Level Trigger

Full event reconstruction, inclusive and exclusive kinematic/geometric selections

Run-by-run detector calibration

Add offline precision particle identification and track quality information to selections

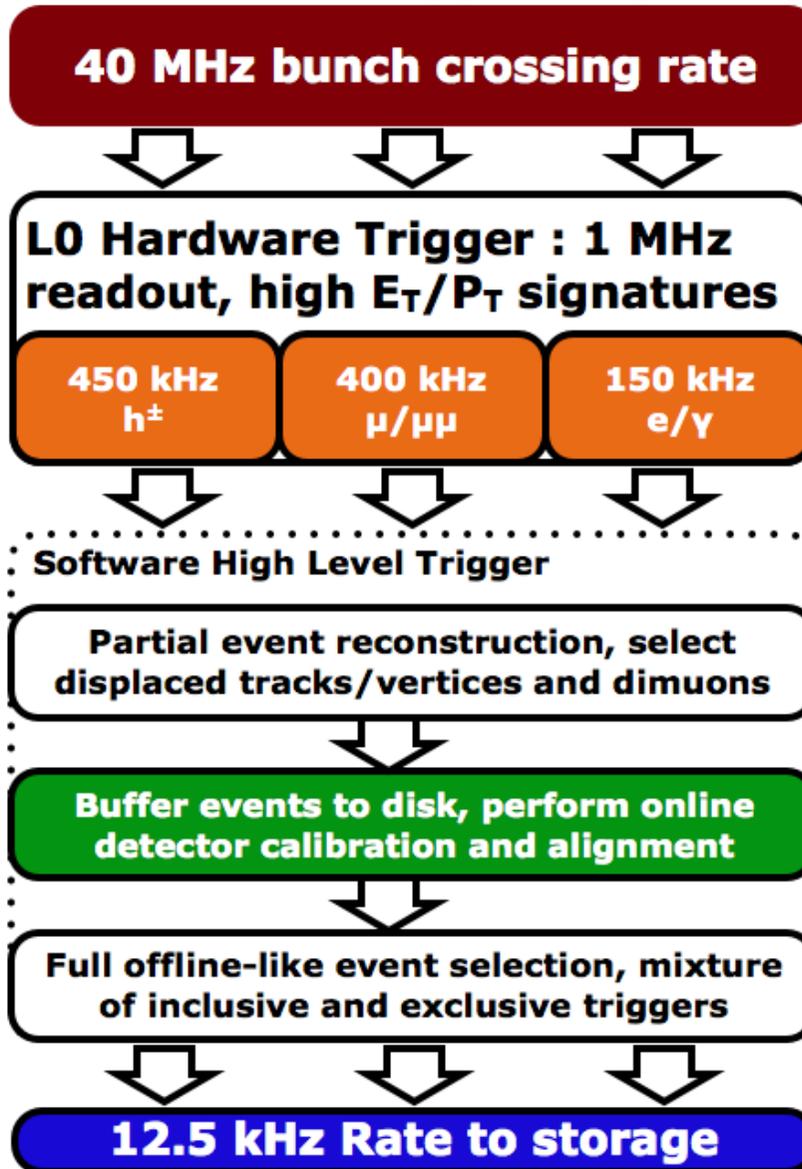

2-5 GB/s rate to storage

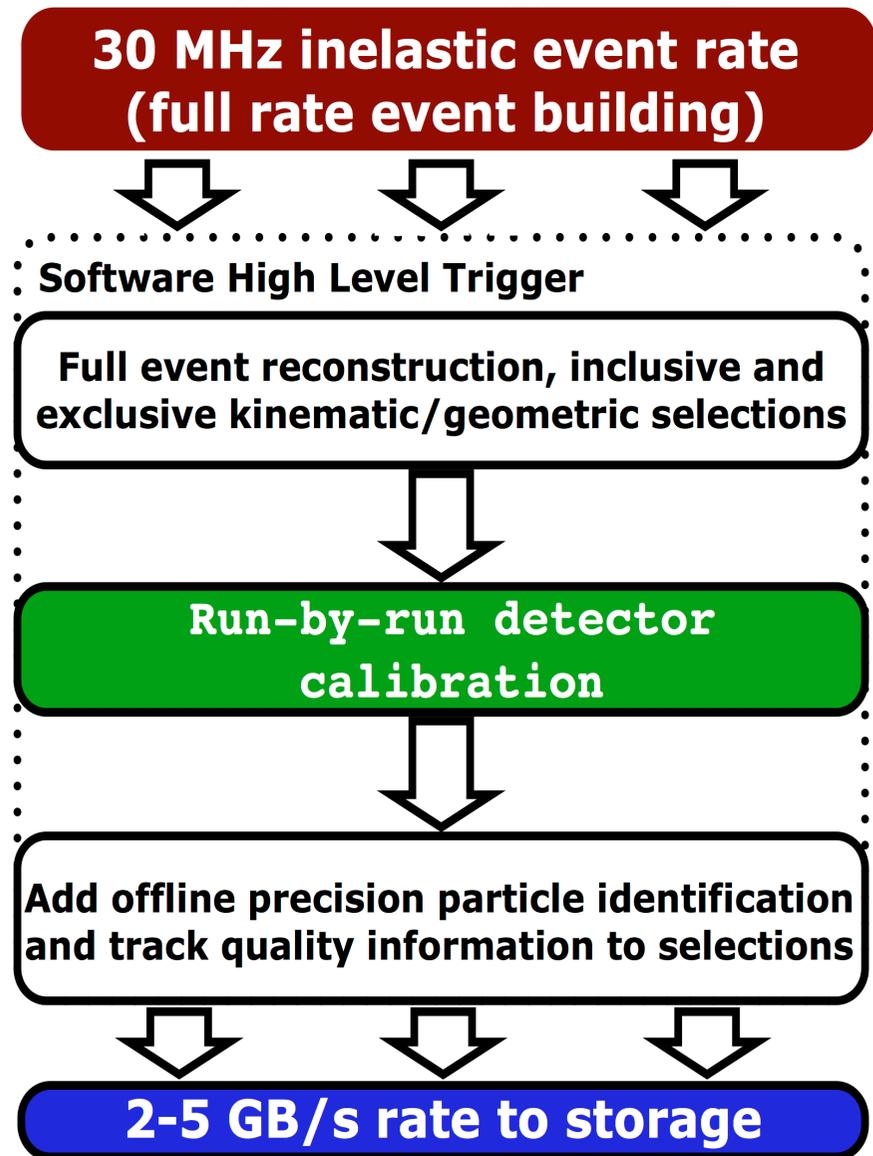

Trigger now and at the upgrade

LHCb 2015 Trigger Diagram

LHCb Upgrade Trigger Diagram

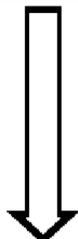

HLT 1 reconstruction strategy

Offline Tracking

Velo tracking

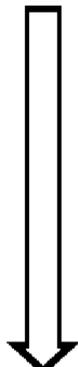

Forward tracking

$p_T > 70$ MeV, $\delta p/p \sim 0.5\%$

PV finding

Full Kalman fit

Particle Identification

Online Tracking

Velo tracking

Velo-UT tracking

$p_T > 200$ MeV, $\delta p/p \sim 15\%$

Forward tracking

$p_T > 500$ MeV, $\delta p/p \sim 0.5\%$

PV finding

Rate reducing cuts

Output < 1 MHz

Muon Identification

Simplified Kalman fit

Particle Identification

- With upgrade tracking detectors
 - Total HLT1 tracking time ~ 6 ms
- Offline quality tracking at 30 MHz is possible in software!
 - Concept already in use (at 1MHz) in Run 2
- LHCb first collider experiment to operate an all-software trigger at full event rate

Computing Model Brainstorming: Reconstruction

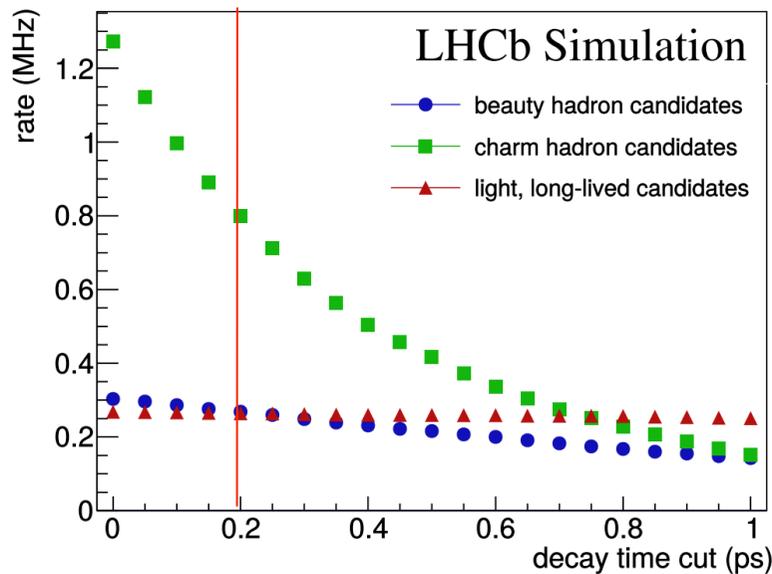

- After HLT 1, data buffered on local disk
 - Deferred processing after offline quality calibration has been obtained
 - ☆ Already planned for Run 2
- Aim to run full offline reconstruction in HLT 2
 - If reconstruction is identical to offline, is there a need to run it again offline?
 - And if reconstruction is not run offline, can we redefine RAW data to be ONLY the reconstruction output?
- CPU budget for reconstruction is crucial
 - Optimise for the HLT farm hardware
 - R&D for alternative architectures
 - ☆ Since reconstruction runs only in one place (HLT farm), can optimise hardware and software together
 - * x86, but also GPU, Xeon Phi, ARM, ...
 - ☆ Metric is events reconstructed per CHF
 - * But remember code must also run on standard CPU (e.g. for offline simulation)

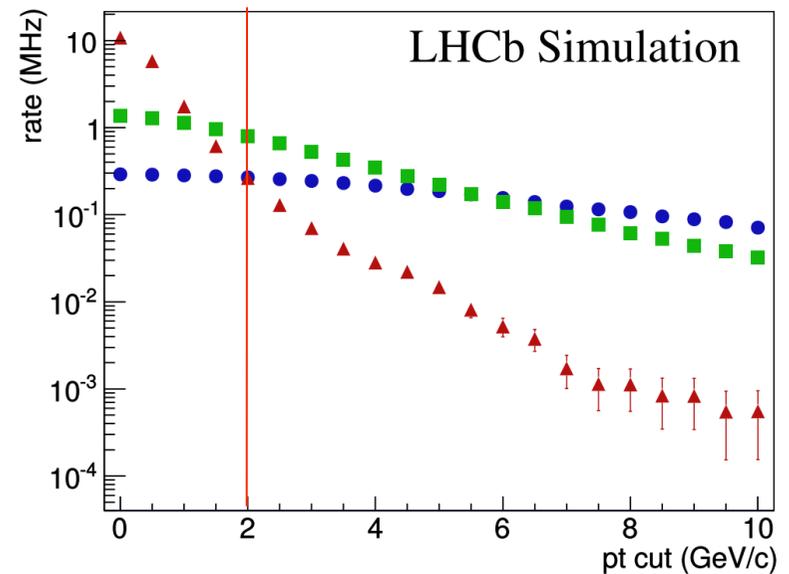

Event selection: The Game Has Changed (© Tim Head)

- In the upgrade area there are no “boring” events, HLT is about classifying signal events!

Rates as a function of decay time cut for part. reco. candidates

Rates as a function of pT cut for part. reco. candidates

- 800 kHz of reconstructible charm hadrons,
270 kHz of reconstructible beauty hadrons
☆ c.f. 2-5 GB/s allowed to offline storage

The Game Has Changed

Brainstorming: The Game Has Changed

- Trigger is no longer selecting events, but classifying them
 - Write out what bandwidth and offline resources allow, but everything written out will be analysed
- In many exclusive analyses, interested only in the decay tree of the triggering signal
 - So write out only the interesting part of the event, not the whole event
 - Turbo Stream idea, being tested in Run 2
 - ☆ 2.5kHz of signal, ~5kB/event, going directly to analysis
 - ☆ x10 reduction in event size
- If all events are interesting offline, current model of stripping no longer applies
 - Streaming more relevant, but how many streams?
 - Is direct access to individual events more relevant?
 - ☆ Needs event index, and R&D on efficient access to single events

Brainstorming: output event rate

- Design range for offline storage is HLT output rate of 2-5 GB/s
 - This represents huge range of event rates, depending on mix of Full events and Turbo events:
 - ☆ 2 GB/s of Full events (100kB) -> 20kHz
 - ☆ 5 GB/s of Turbo events (5kB) -> 1MHz
 - Reality will be somewhere in between, physics optimisation of bandwidth to be done
- Main implication for offline resources is CPU for simulation
 - Factor 50 in events to be simulated between two extremes above
 - ☆ This will be important ingredient of physics optimisation
 - Clear that major development effort in Fast MC techniques is needed
 - ☆ Already started for Run 2 physics, focusing on reducing needs for full simulation
 - * Parametric approaches, partial event simulation

Brainstorming: storage model

- Three classes of storage
 - Disk for active data analysis
 - ☆ Real data, frequently accessed simulation
 - Active Tape
 - ☆ Less frequently accessed simulation
 - ☆ Migration between disk and tape based on popularity predictions
 - Archive Tape
 - ☆ Only for data, simulation and analysis preservation
 - * No need for large disk cache
 - * No I/O latency constraint, can be outsourced?
- A few sites for disk, even fewer for tape
 - ~3 sites with active tape sufficient
 - Sufficient disk sites to provide low latency and high availability for analysis jobs
 - ☆ No technical need for many small disk pools
 - * (but recognise it as important funding/sociological issue)
- CPU can continue to be anywhere
 - Current WLCG distributed model
 - Leverage on opportunistic resources for simulation

- Three areas of research:
- Software optimisation
 - Use cases: reconstruction on HLT farm, fast simulation
- I/O optimisation
 - Use case: sparse event access
- Storage optimisation
 - Use cases: data popularity, archiving
