

Introduction to Particle Physics I

Sinéad Farrington

18th February 2015

The Large Hadron Collider

- Collisions of
- Superconduct
- 2808 bunches
- 99.99999
- Interactions between beams every 25 nanoseconds

energy

collisions per second

seconds

The Large Hadron Collider

	LHC	Circle line
Circumference	27km	22.5km
Depth	100m	15m
Diameter	3.8m	3.4m

Particle Collisions

Two particles collide at very high energy.
New particles are produced which we detect and study

Why?

Understanding the Universe

Older larger ... colderless energetic

How do we do it?

- To probe the conditions of the early universe we smash particles together

The Energy Frontier

- Size of structure we can probe with a collider like LHC

$$\lambda = h / p \quad (\text{de Broglie, 1924})$$

h = Planck's constant = 6.63×10^{-34} Js

p = momentum of protons

- The larger the momentum (energy), the smaller the size probed

Standard Model of Particle Physics

- Strong, weak and Electromagnetic forces
- Describes interaction of matter particles by the means of force carrier particles

Matter Particles

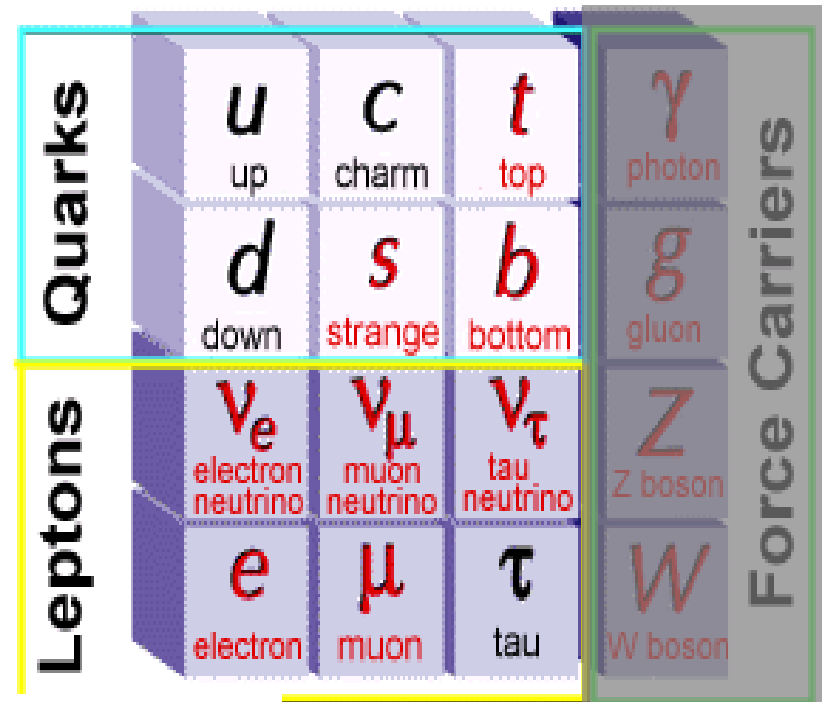

- First generation: these are the only particles needed to make all the matter we see; all chemical elements

Particle	symbol	charge	type
Electron	e^-	-1	lepton
Neutrino	ν_e	0	lepton
Up-quark	u	+2/3	quark
Down-quark	d	-1/3	quark

Matter Particles

- But we see three generations
 - Undergoing similar interactions
 - Mass hierarchy
 - Each has an antiparticle

First Generation		2 nd Generation		3 rd Generation		Charge
Electron Neutrino	ν_e	Muon neutrino	ν_μ	Tau neutrino	ν_τ	0
Electron	e ⁻	Muon	μ^-	Tau	τ^-	-1
Up quark	u	Charm quark	c	Top quark	t	+2/3
Down quark	d	Strange quark	s	Bottom quark	b	-1/3

Forces

- In the Standard Model, we depict (and calculate) forces as the exchange of a force-carrier boson, between particles

Quarks	u up	c charm	t top	γ photon	
	d down	s strange	b bottom		g gluon
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino		
Leptons	e electron	μ muon	τ tau	Z Z boson	
				W W boson	

Electromagnetic Force

- Mediated by the **photon**
- Acts on particles carrying electric charge

Quarks	u up	c charm	t top	γ photon
	d down	s strange	b bottom	g gluon
Leptons	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	Z Z boson
	e electron	μ muon	τ tau	W W boson

Strong Force

- Mediated by the **gluon**
- Acts on particles carrying colour charge

Quarks	u up	c charm	t top	γ photon	Force Carriers
	d down	s strange	b bottom	g gluon	
Leptons	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	Z Z boson	
	e electron	μ muon	τ tau	W W boson	

Weak Force

- Mediated by the W , Z bosons
- Acts on all matter particles

Quarks	u up	c charm	t top	γ photon
	d down	s strange	b bottom	g gluon
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	Z Z boson
Leptons	e electron	μ muon	τ tau	W W boson

Gravitational Force

- Mediated by the Graviton?
- Acts on all massive particles

Quarks	u up	c charm	t top	Force Carriers
	d down	s strange	b bottom	
Leptons	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	
	e electron	μ muon	τ tau	
			γ photon	
			g gluon	
			Z Z boson	
			W W boson	

Relative Strengths of Forces

Each force has an intrinsic strength

Electromagnetism:

$$F = \frac{q_1 q_2}{4\pi\epsilon_0 r^2}$$

$$\alpha = \frac{q_1 q_2}{4\pi\epsilon_0 \hbar c} = \frac{g^2}{4\pi}$$

$$F = \frac{\alpha}{r^2}$$

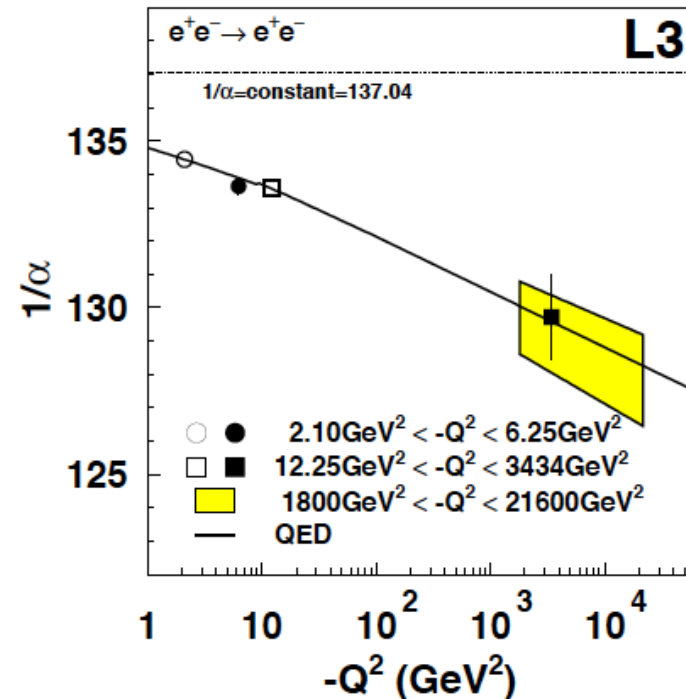

Relative Strengths of Forces

Each force has an intrinsic strength

Strong:	$\alpha_s \sim 1$
Electromagnetic:	$\alpha_{em} \sim 1/137$
Weak:	$\alpha_W \sim 10^{-6}$
Gravity:	$\alpha_g \sim 10^{-40}$

Running Couplings

- When is a constant not a constant?
- The forces' intrinsic strengths change with distance (or momentum) scale
- Electromagnetic screening process: the bare particle charge is screened by e^+e^- pairs

Running Couplings

- When is a constant not a constant?
- The forces' intrinsic strengths change with distance (or momentum) scale
- Strong force screening process: same as EM but has an additional effect

Running Couplings

- When is a constant not a constant?
- The forces' intrinsic strengths change with distance (or momentum) scale
- Strong force screening process: same as EM but has an additional effect

Unification?

Compare the Forces

EM force

Electric charge (1)

Massless photon

Coupling g

Weak force

Weak charge (2)

Massive W^\pm, Z

Coupling g_W

Strong force

Colour charge (3)

8 massless gluons

Coupling g_s

Allows quark flavour to change so that matter can change into antimatter

Higgs Boson

- **Introduced to give mass to W and Z bosons**
 - Requires a new potential to be added to the Standard Model
 - Introduction of “complex doublet” implies 4 new degrees of freedom, 3 of which are the W^+ , W^- Z boson mass
 - Fourth is the Higgs boson itself

Summary

- **The Standard Model describes the fundamental particles and the forces that act among them**
 - Forces are mediated by force-carrier bosons
 - While the forces are mediated in a common way, they display different phenomena
- **Tomorrow's lecture: Experimental measurements**
 - How do we know what we know?
 - What does a data analysis look like?
(Example: The Higgs Search)
- **Question... Relative merits of pp , $p\bar{p}$, e^+e^-**
