ACAT 2008

Contribution ID: 216

Type: Parallel Talk

## FormCalc 6

Wednesday, 5 November 2008 14:50 (25 minutes)

The talk will cover the latest version of the Feynman-diagram calculator FormCalc. The most significant improvement is the communication of intermediate expressions from FORM to Mathematica and back, for the primary purpose of introducing abbreviations at an early stage. Thus, longer expressions can be treated and a severe bottleneck in particular for processes with high multiplicities removed.
