Architecture

Docker + jupyterhub = everware

If the code's environment is specified in a Dockerfile, everware will build it, launch it and connects you to it via your browser.

Demo!

(code in <https://github.com/betatim/everware-demo>)

What We Have

- working demos
- author decides how to structure their software
 - notebooks are amazing, trust me ... but you don't have to use them.
- pluggable user authentication
- (secret) git repositories as source
- docker and docker-swarm
- run locally during development
 - provides an incentive to the author to write a Dockerfile

What We Want (or would like to have)

- computing sponsors
- collaborators \rightsquigarrow <http://github.com/everware>
- launch containers on resources belonging to the user
- polished user interface/iron out kinks
- better root/cling kernel for jupyter
- you to talk to me (analysis preservation, interactive tutorials, hosting everware, ...)

Be crazy, Join us!
