

SEARCHES FOR SUSY/DARK MATTER WITH TOP QUARKS

Top2015 - 8th International Workshop on Top Quark Physics
17 September 2015

Sophio Patariaia

(Bergische Universität Wuppertal)

on behalf of the ATLAS and CMS Collaborations

CONTENT

- Part I
 - ▶ Introduction: natural SUSY
 - ▶ Third generation squark searches
- Part II
 - ▶ Dark Matter + t/\bar{t} searches
 - ▶ MonoTop searches
- Summary

Results shown are all with full 2012 dataset (~ 20 fb⁻¹ at $\sqrt{s}=8$ TeV)

INTRODUCTION: NATURAL SUSY

SM - huge radiative corrections to Higgs mass \Rightarrow high-levels of fine tuning

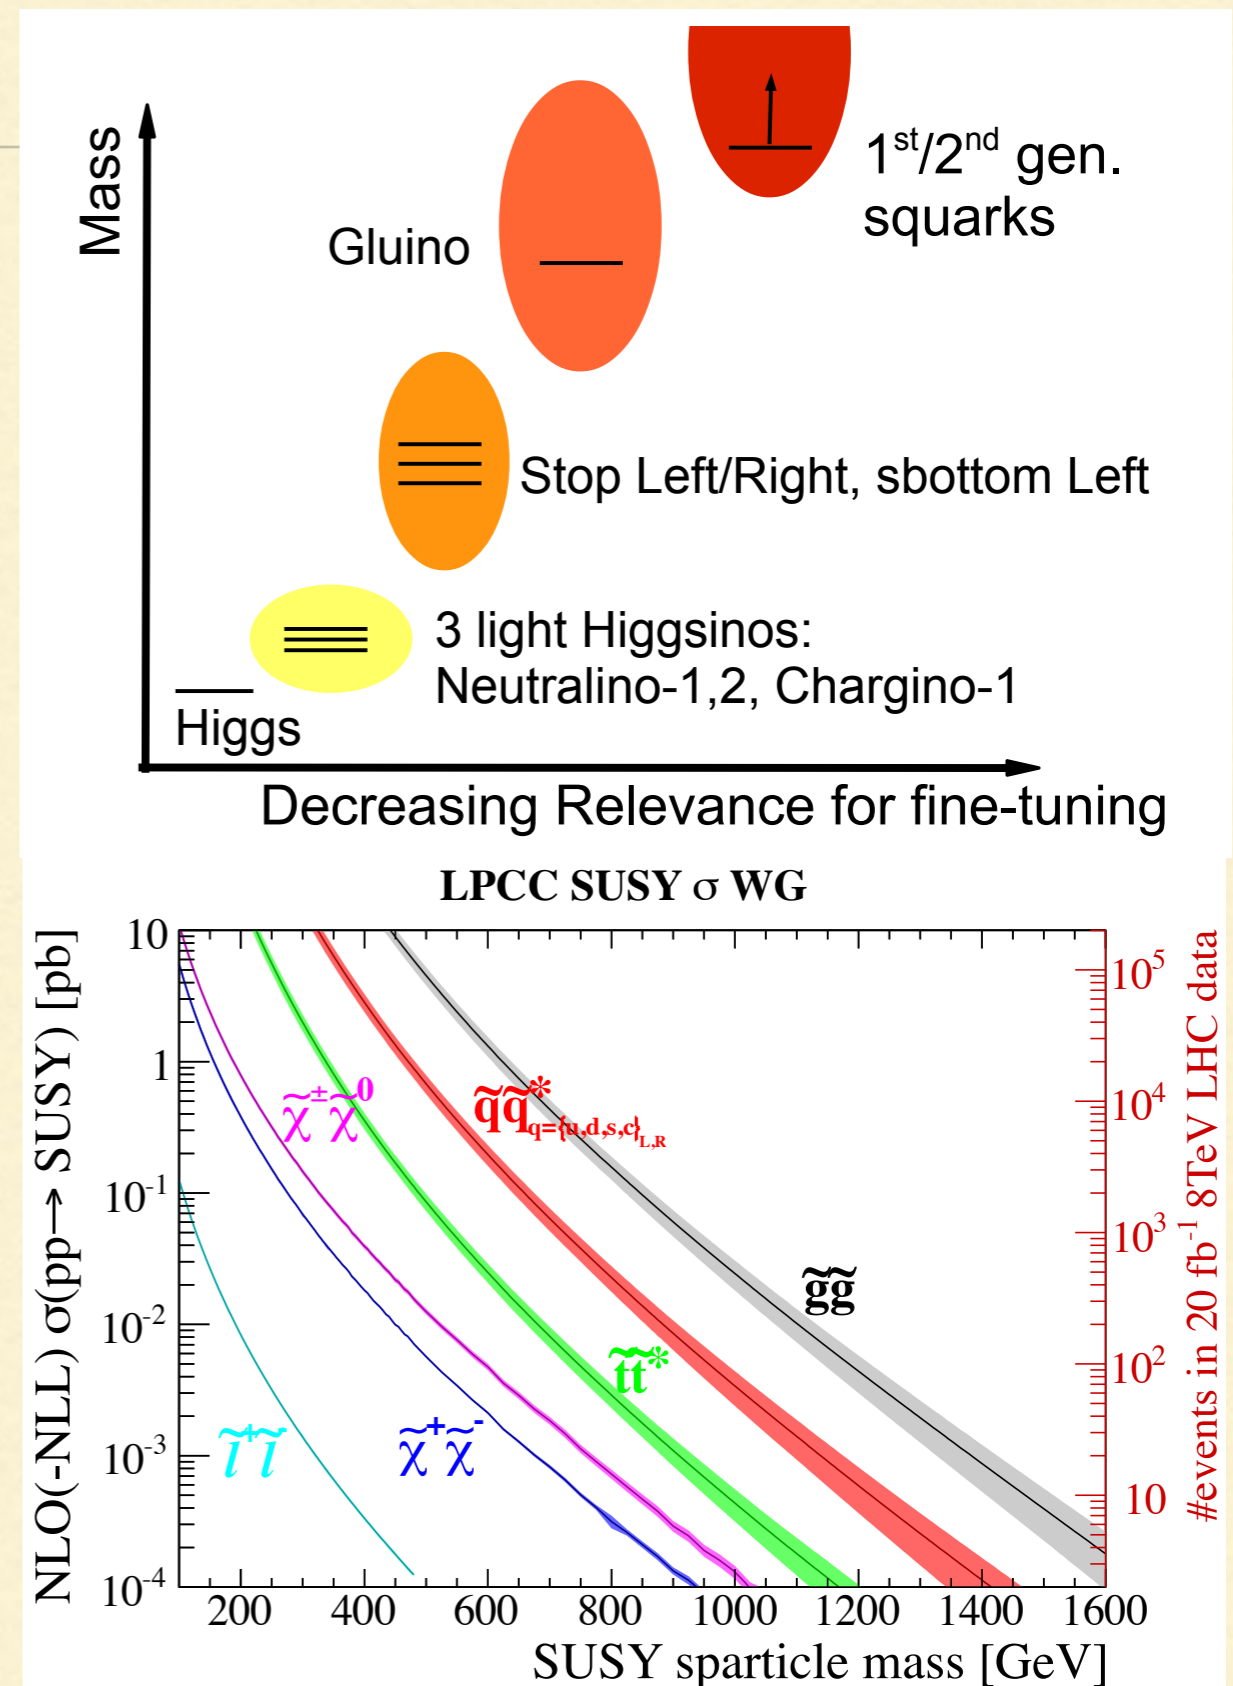

SUSY - corrections to the Higgs (soft) mass are driven by the top/stops system,

Natural SUSY - low fine tuning:

- average mass of two Stops in the sub-TeV range
- at least one light Sbottom (part of the LH multiplet)

Light 3rd generation (≤ 1 TeV) preferred by naturalness.

Direct Stop 1,2 production

Glino Mediated Stop production

Simplified models:

- ~ Decoupled sparticle spectra, particles of no interest considered very massive, isolated single production and decay mode
- ~ Decay BR are assumed to be 100% into a selected mode

ATLAS: $t\bar{t}$ + ETMISS

1L+4J

1L+6J

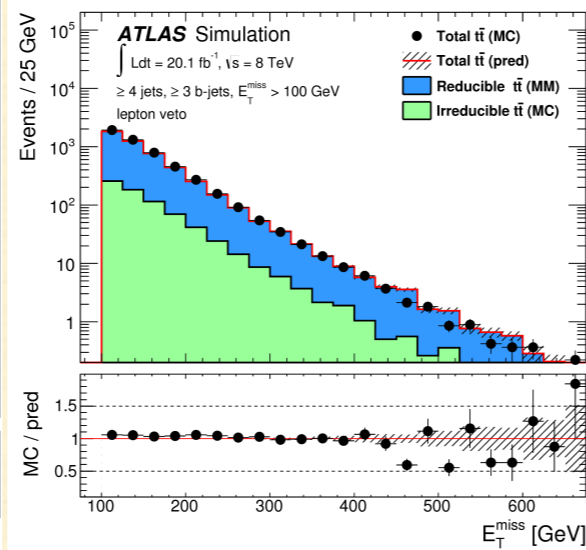

2L+2J

3L+3J

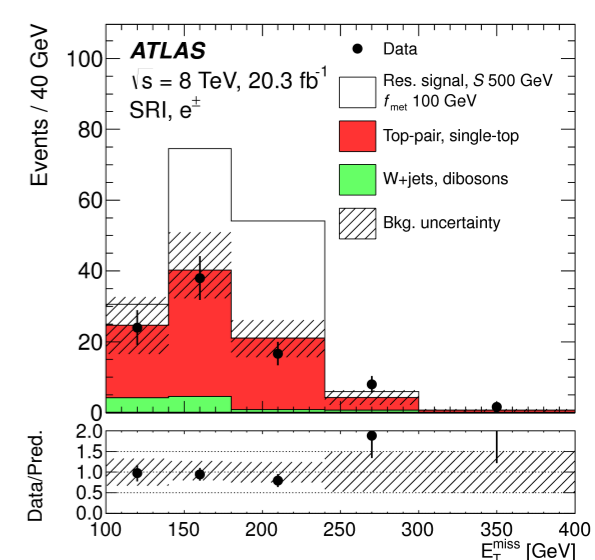

4J+3b

1L + 4jets

2L+2bjets

2L+2jets

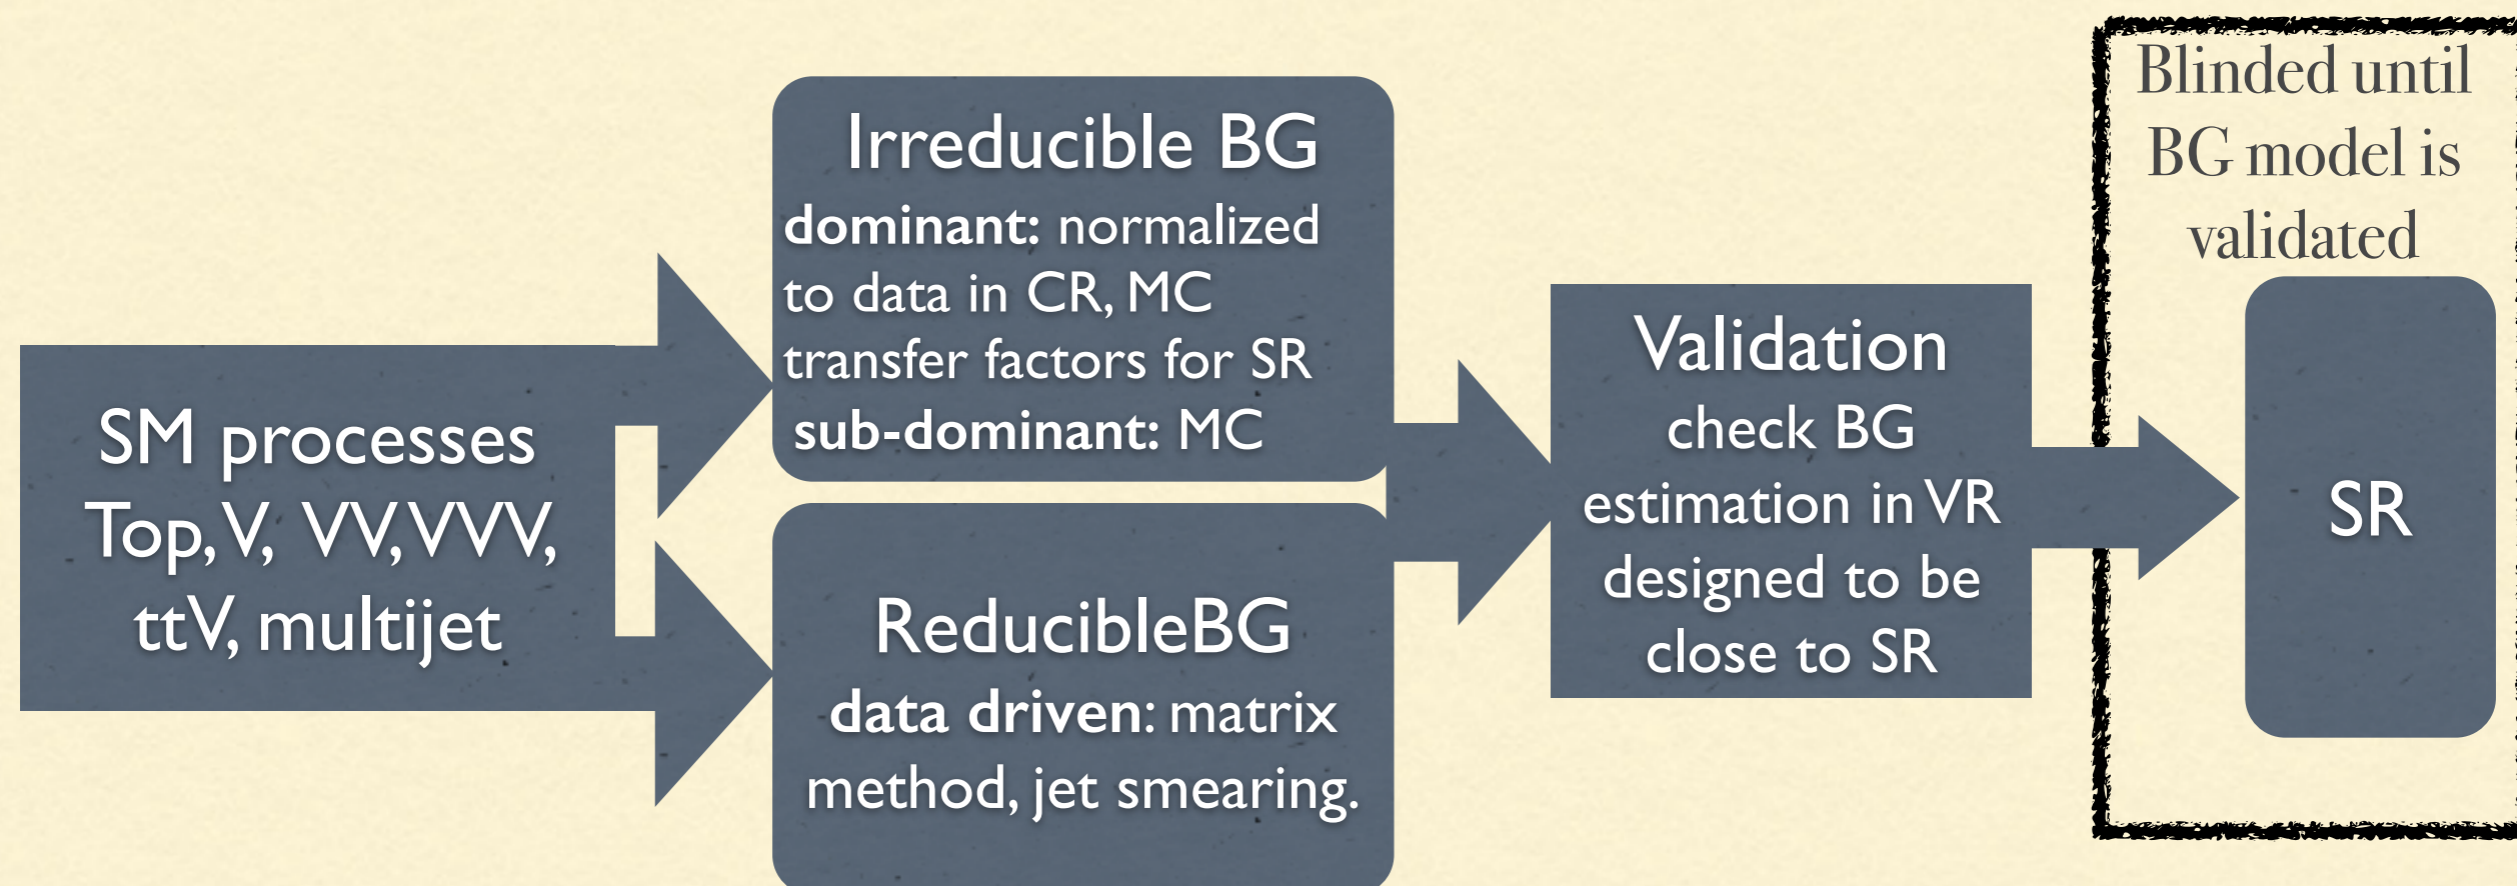

3L+1b

1L+3jets

ATLAS: SM BG ESTIMATION

Light 3rd generation \Rightarrow very SM like

Direct production cross section small \Rightarrow need precise measurements of SM tails

Notations: Standard Model - SM, Background - BG, Monte Carlo - MC, Control Region - CR, Validation Region - VR, Signal Region - SR, Transfer Factor - TF.

ATLAS: SYSTEMATICS & COMBINED FIT

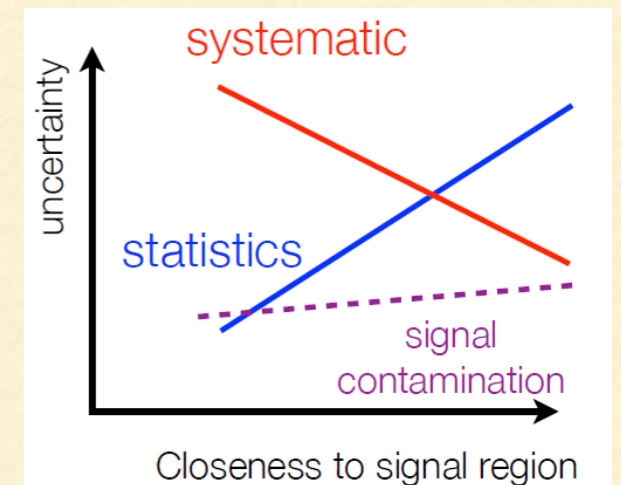

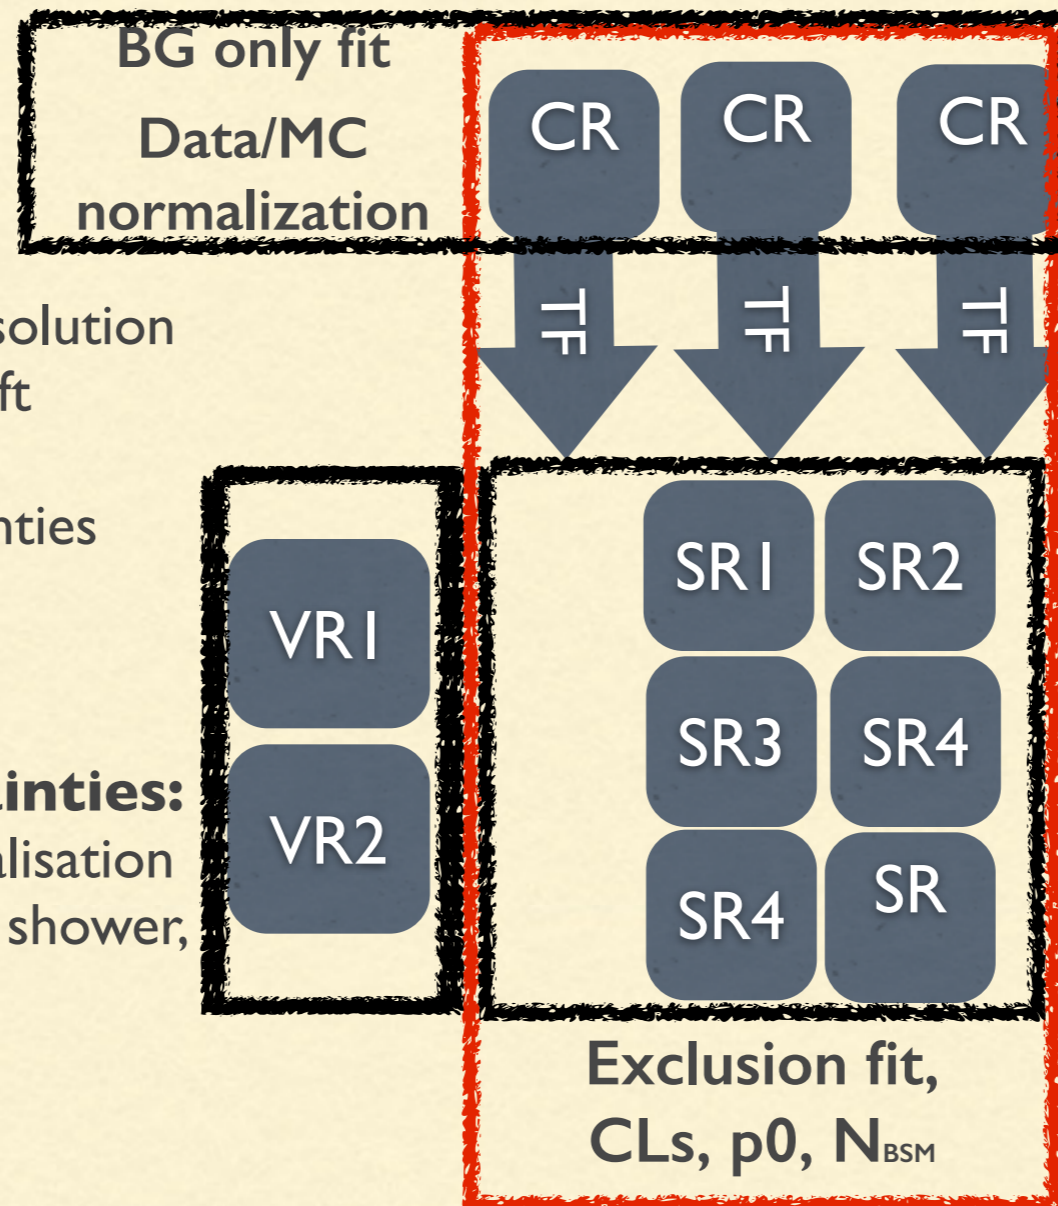

Detector systematics:

- Jet Energy Scale (JES)
- Jet Energy Resolution (JER)
- b-tagging uncertainties
- Lepton ID, energy scale & resolution
- Missing Transverse Energy soft component
- Trigger: scale factor uncertainties
- Luminosity uncertainty
- Pileup

BG MC modeling uncertainties: generator choice, PDF, renormalisation and factorization scales, parton shower, ISR/FSR.

Signal systematics:

- ISR/FSR, parton shower, PDF, renormalisation and factorization scales and strong coupling (α_s) uncertainty.

multiple SRs per analysis

1. if SRs overlap use one with best expected sensitivity,
2. if SRs are orthogonal do statistical combination for model dependent exclusion reach + signal contribution in CRs, but use 1 most sensitive SR bin for discovery fits + no signal contribution in CRs.

TT(T)+ ETMISS SEARCHES AT LHC

Measurements of the inclusive top-quark pair production cross section in the $e\mu$ decay channel in pp collisions at $\sqrt{s} = 7$ and 8 TeV - PAS TOP-13-004

SUMMARY OF STOP SEARCHES AT LHC

$\tilde{t}\text{-}\tilde{t}$ production, $\tilde{t} \rightarrow t \tilde{\chi}_1^0 / c \tilde{\chi}_1^0$

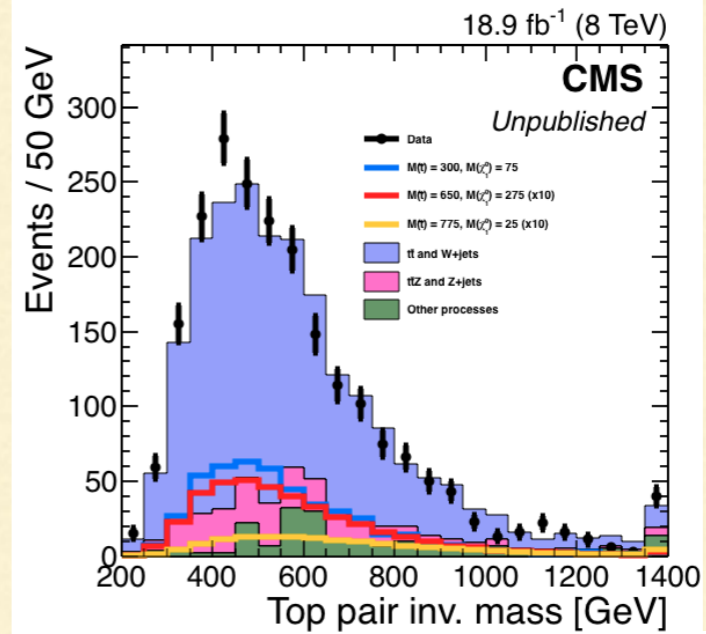

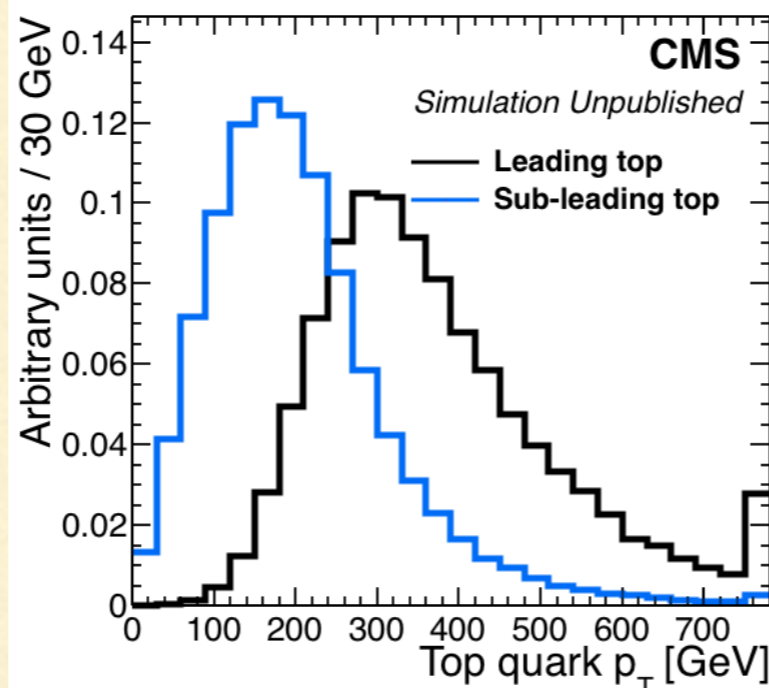

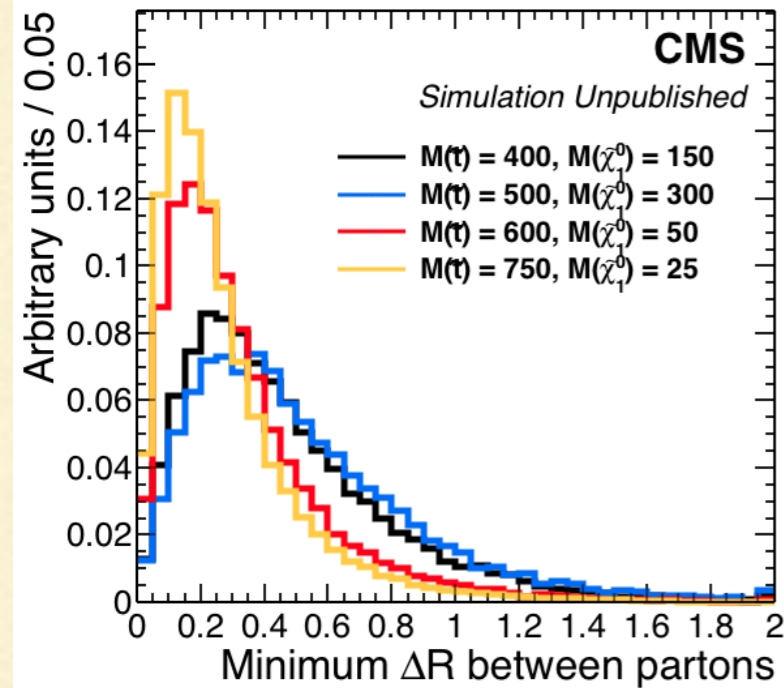

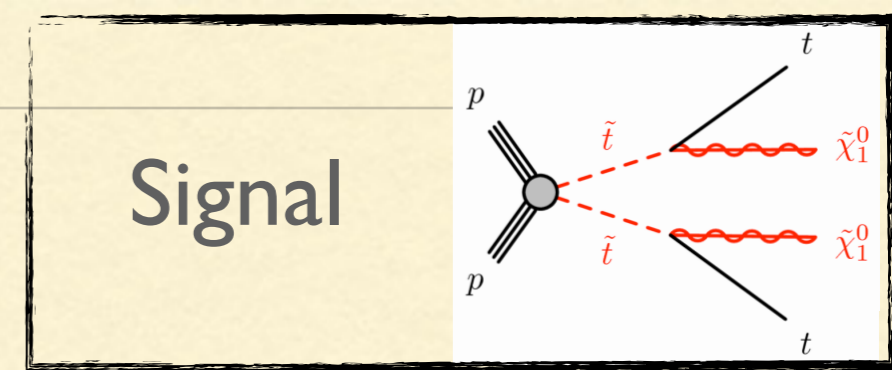

$\tilde{t}\tilde{t}_1$ production, $\tilde{t}_1 \rightarrow b f f' \tilde{\chi}_1^0 / \tilde{t}_1 \rightarrow c \tilde{\chi}_1^0 / \tilde{t}_1 \rightarrow W b \tilde{\chi}_1^0 / \tilde{t}_1 \rightarrow t \tilde{\chi}_1^0$

CMS: STOP SEARCHES

PAS-SUS-13-023

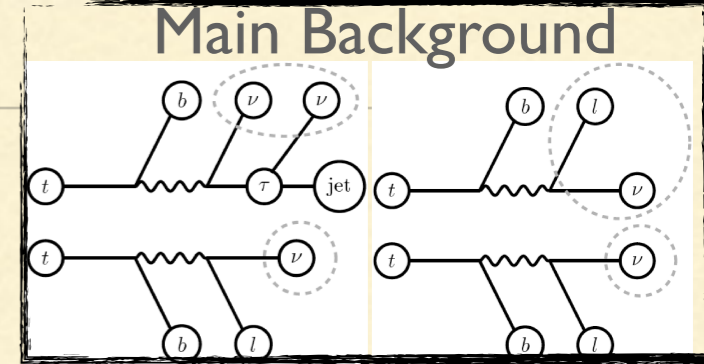

Dedicated high efficiency top pair reconstruction input “fat jets”, CA $\Delta R=1$, split into smaller sub-jets
MVA-based top pair reconstruction: choose best pair of “top candidates”

4 BDTs (optimised for different stop mass), 24 input variables, including MET, “top candidate” MVA values for object ID

ATLAS: STOP SEARCHES

arXiv: 1506.08616

1L, ≥ 4 jets, ≥ 1 b/2b-jets, $m_T > 120$ to 200 GeV, $130 < m(\text{jij}) < 205$ GeV, $E_{\text{miss}} > 100$ to 275 GeV, **amT2** > 170 to 200 GeV, **mT2_tau** > 80 GeV.
2D binned shape fit: m_T [60-140-] GeV and E_{miss} [100-150-] GeV.
 mostly stop-right handed vs purely stop-left handed \Rightarrow drop of the sensitivity (~ 75 GeV) \Rightarrow lepton kinematics depends on Top polarisation.
Main Backgrounds: tt, ttV, V+jets.

0L, ≥ 6 jets, ≥ 2 bjets, $E_{\text{miss}} > 200$ to 350 GeV, $m_T(\text{b-jet}, E_{\text{miss}}) > 175$ GeV, tau veto.
 Full reconstruction of tt (3 closest jets in $\eta - \phi$ plane), 2 top with $80 < m(\text{jij}) < 270$ GeV.
 Analysis insensitive to Stop polarization (L/R).
Main Backgrounds: tt, Z+jets, ttV.

m_Stop - m_LSP \gg m_Top, Boosted Regime

0L, 4-5 resolved jets, 2 fat jet anti-kt R=0.8/1.2

top mass asymmetry,
$$\mathcal{A}_{m_t} = \frac{|m_{\text{jet}, R=1.2}^0 - m_{\text{jet}, R=1.2}^1|}{m_{\text{jet}, R=1.2}^0 + m_{\text{jet}, R=1.2}^1}$$

1L, 4 resolved jets, 1 fat jet anti-kt R=1.0

CONSTRAINTS FROM $t\bar{t}$ CROSS SECTION MEASUREMENTS

Constraint from Top spin measurement shown by J.Linacre

PAS-TOP-13-004

arXiv: 1506.08616

CMS method: template fit

data set: 7TeV + 8TeV

channel: emu OS, 0, 1, 2, 3+ bjet bins

ATLAS method: cut and count

data set: 7TeV + 8TeV

channel: 2L OS, 1, 2 bjets

$\sigma(7 \text{ TeV}) = 174.5 \pm 2.1(\text{stat})^{+4.5}_{-4.0}(\text{syst}) \pm 3.8(\text{lumi}) \text{ pb } (+3.6\% -3.4\%)$
 $\sigma(8 \text{ TeV}) = 245.6 \pm 1.3(\text{stat})^{+6.6}_{-5.5}(\text{syst}) \pm 6.5(\text{lumi}) \text{ pb } (+3.8\% -3.5\%)$

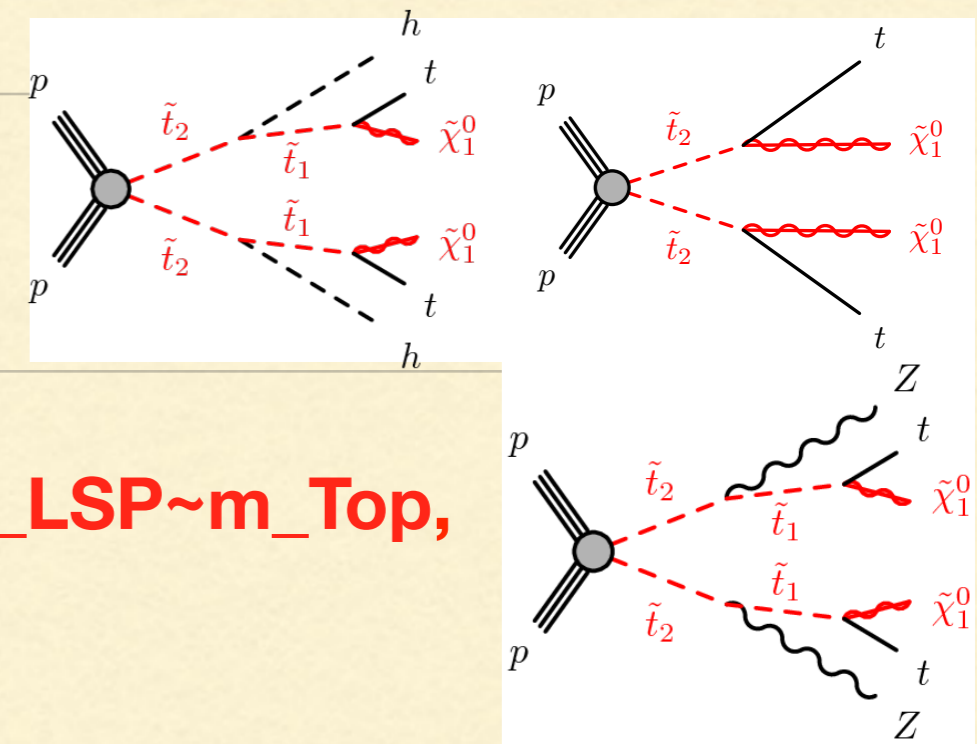

$\sigma_{t\bar{t}} = 182.9 \pm 3.1 \pm 4.2 \pm 3.6 \pm 3.3 \text{ pb } (\sqrt{s} = 7 \text{ TeV})$
 $\sigma_{t\bar{t}} = 242.4 \pm 1.7 \pm 5.5 \pm 7.5 \pm 4.2 \text{ pb } (\sqrt{s} = 8 \text{ TeV})$

Extra contribution to $t\bar{t}$ production with soft missing energy – $> 180 \text{ GeV}$ stop-pair contribution is 32 pb at 8 TeV c.f. QCD $t\bar{t}$ of $\sim 250 \text{ pb}$.

CMS: STOP2 SEARCHES

PLB 736.371

Target the challenging phase space **$m_{\text{Stop1}} - m_{\text{LSP}} \sim m_{\text{Top}}$** , (stealth) stop1 and Z or H.

Final states with H -> bb, ZZ, WW

Selection: 1L, 2L (SS, OS), and $\geq 3L$
 + b-jet (up to 4),

dominant background: fake leptons, VV.

ATLAS: STOP2 SEARCHES

arXiv: 1506.08616

Final states with Z

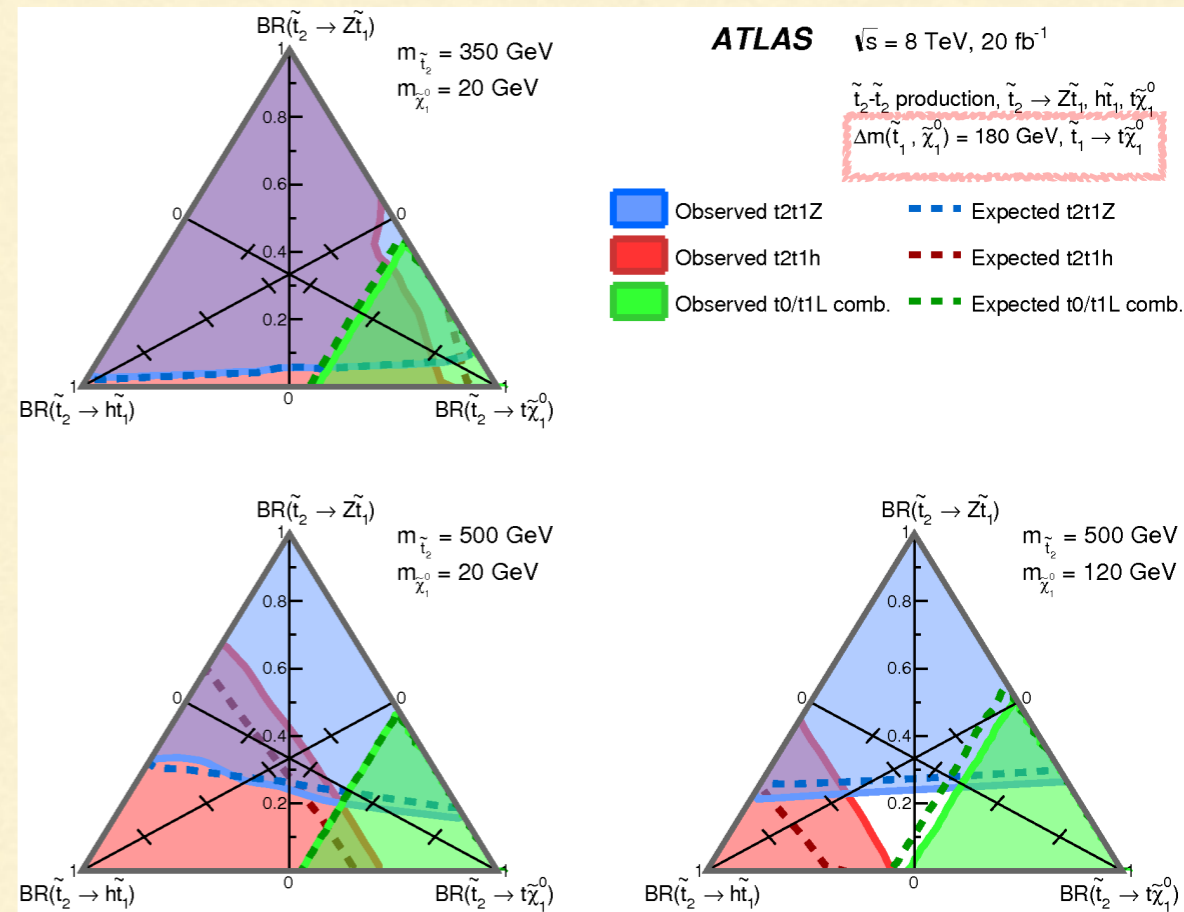

2L (SS), 3L(2L OSSF), Z(ll), + jets + 1bjets + Emiss
dominant background, ttV, fake leptons.

Final states with H

1L, Emiss > 50 GeV, >=6jets, >=2bjets (binning: 2,3,4+ bjets), mTw > 130GeV, final discriminating variable HT - scalar sum of all jets and etmiss.

key relevance tthf modelling: tt+bb with POWHEG and reweighted to a full NLO calculation performed in SHERPA 1.4.1+OpenLoops.

ttcc and ttll re-weighting done using 7TeV differential cross section measurement.

GLUINO-MEDIATED STOP PRODUCTION

arXiv: 1507.05525

PLB 733.328

Gluino decays via on- or off-shell stop gives $4t + E_{\text{miss}} \Rightarrow$ high object multiplicity

$0L + \geq 4$ jets or ≥ 7 jets, ≥ 3 bjets

$1L + \geq 6$ jets, ≥ 3 bjets

High E_{miss} , m_t , m_{eff} (scalar sum of jets+ E_{miss})
dominant background, fake b, $ttHF$, ttZ/h .

1 lepton + 6 jets + 2 b -tags

$H_T > 400$ GeV & $S^{\text{lep}} = E_{\text{T}}^{\text{lep}} + p_{\text{T}}^{\text{lep}} > 250$ GeV
dominant background: dileptonic tt

$\tilde{g}\tilde{g}$ production, $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$; $m(\tilde{t}) \gg m(\tilde{g})$, including up to five-body decays

$\tilde{g}\tilde{g}$ production, $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$

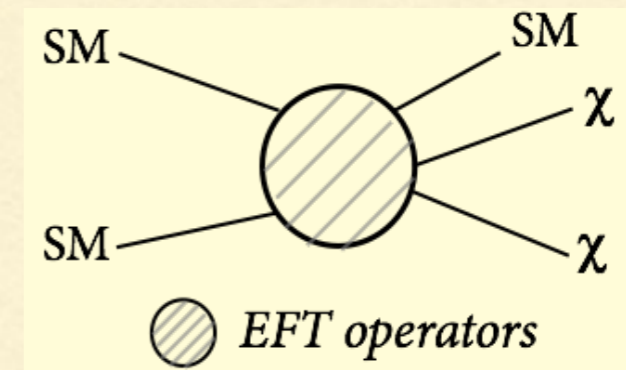

INTRODUCTION: DM+HF

DM likely to be ‘non-baryonic cold dark matter’ → ‘WIMP’ → BSM

Properties of low mass DM:

- Pair produced (stable)
- Mediating particle not directly observed → Effective Field Theory(EFT)

WIMP-DM (χ)	ID	interaction	Operator	G_χ
Dirac scalar	D1	quarks	$\bar{\chi}\chi\bar{q}q$	m_q/M_*^3
Dirac vector	D5	quarks	$\bar{\chi}\gamma^\mu\chi\bar{q}\gamma_\mu q$	$1/M_*^2$
Dirac axial-vector	D8	quarks	$\bar{\chi}\gamma^\mu\gamma^5\chi\bar{q}\gamma_\mu\gamma^5 q$	$1/M_*^2$
Dirac tensor	D9	quarks	$\bar{\chi}\sigma^{\mu\nu}\chi\bar{q}\sigma_{\mu\nu} q$	$1/M_*^2$
Dirac scalar	D11	gluons	$\bar{\chi}\chi G_{\mu\nu}G^{\mu\nu}$	$\alpha_s/4M_*^3$
complex scalar	C1	quarks	$\chi^\dagger\chi\bar{q}q$	m_q/M_*^2
complex scalar	C5	gluons	$\chi^\dagger\chi G_{\mu\nu}G^{\mu\nu}$	$\alpha_s/4M_*^2$

Sensitivity for a scalar interaction can be improved by searching for final states with third generation quarks, two free parameters:

m_χ - mass of DM candidate

M^* - effective mass scale of the interaction

DM+TT RESULTS

EPJC 75 (2015) 92

ATLAS

== 1L, ≥ 4 jets, ≥ 1 bjets, MET > 270 GeV,
mT > 130 GeV, amT2 > 190 GeV, topness > 2,

dominant background: dileptonic tt

JHEP 06 (2015) 121

CMS

== 1L, ≥ 3 jets, ≥ 1 bjets, MET > 320 GeV,
mT > 160 GeV, mT2w > 200 GeV

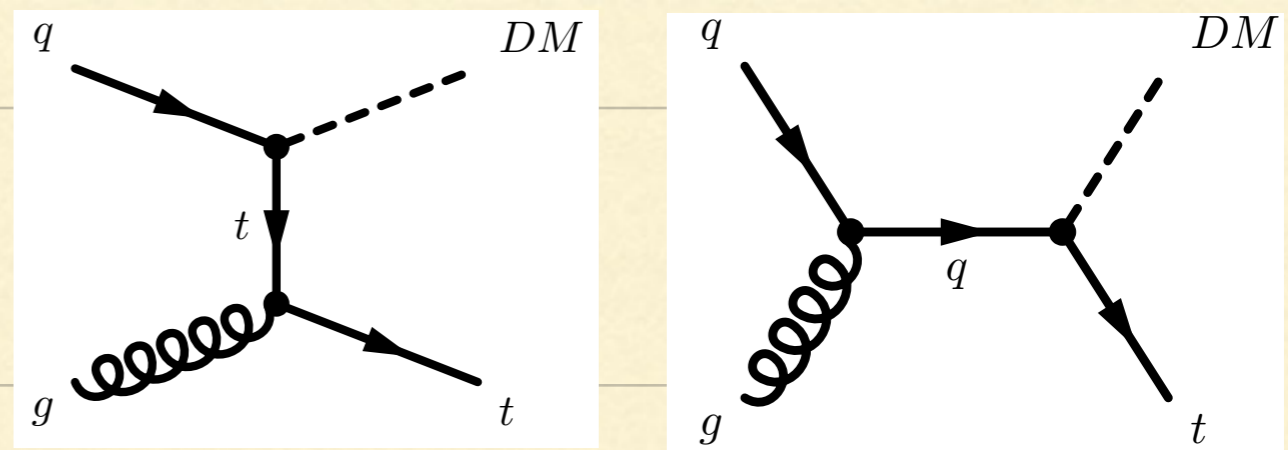

dominant background: dileptonic tt

EFT are valid only for high mass mediators ($> O(\text{TeV})$) and rather light dark matter candidates $O(\text{GeV})$

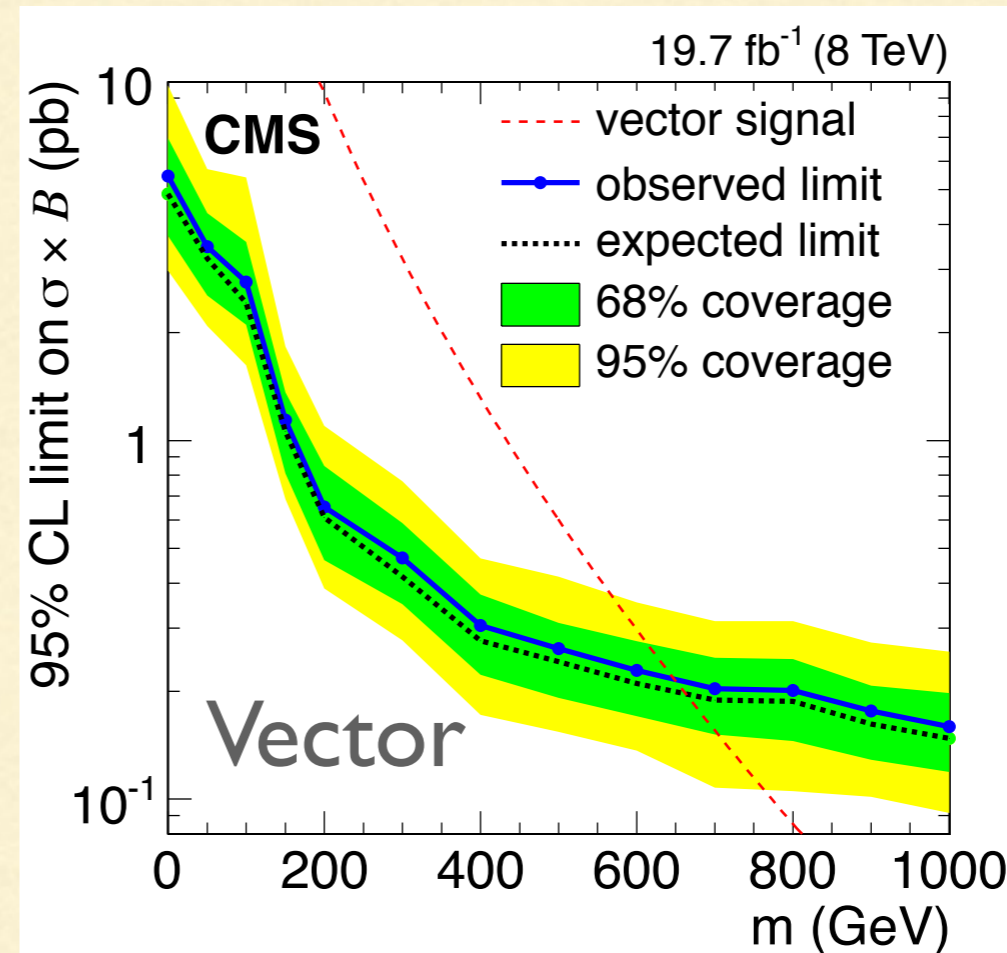

CMS: DM+T

PRL 114 (2015) 101801

$t \rightarrow bW \rightarrow bqq'$

Selection: 0L, 3jets, $m_{jjj} < 250 \text{ GeV}$, $\text{MET} > 350 \text{ GeV}$; dominant background: tt , V jets.

the observed lower limits on mass for invisible particles are set at 330 GeV (scalar) and 650 GeV (vector). For a coupling constant $a_{FC} = 0.2$ these limits increase to 530 and 930 GeV.

ATLAS: TOP+INVISIBLE

EPJC (2015) 75:79

$$t \rightarrow bW \rightarrow bl\nu$$

$$L + \cancel{E} = |b\text{jet} + E_{\text{miss}}| > 35 \text{ GeV}$$

- SRI (resonant model optimisation):
 $m_T(\ell, E_T^{\text{miss}}) > 210 \text{ GeV}$ and $|\Delta\phi(\ell, b)| < 1.2$
 - SRII (non-resonant model optimisation):
 $m_T(\ell, E_T^{\text{miss}}) > 250 \text{ GeV}$ and $|\Delta\phi(\ell, b)| < 1.4$
- dominant background: dileptonic $tt, W\text{jets}$

production of a coloured scalar resonance Stop quark and a spin-1/2 fermion

production of a top quark in association with a spin-1 boson

SUMMARY

- Very diverse Top final states in searches, Top+Emmiss, TT+Emmiss, 4Top+Emmiss
- Covering all Top decays, full hadronic, semi-leptonic, dileptonic
- SM Top plus extra Emmiss means not fully reconstructed events, objects out of acceptance or wrong ID
- Most relevant:
 - ~ good Top theory modelling in all corners
 - ~ Efficient and robust Top reconstruction for all topologies
