

# **Search for excited muons in four muons final state**

Waleed Ahmed Mohammed  
Zewail City for Science and Technology

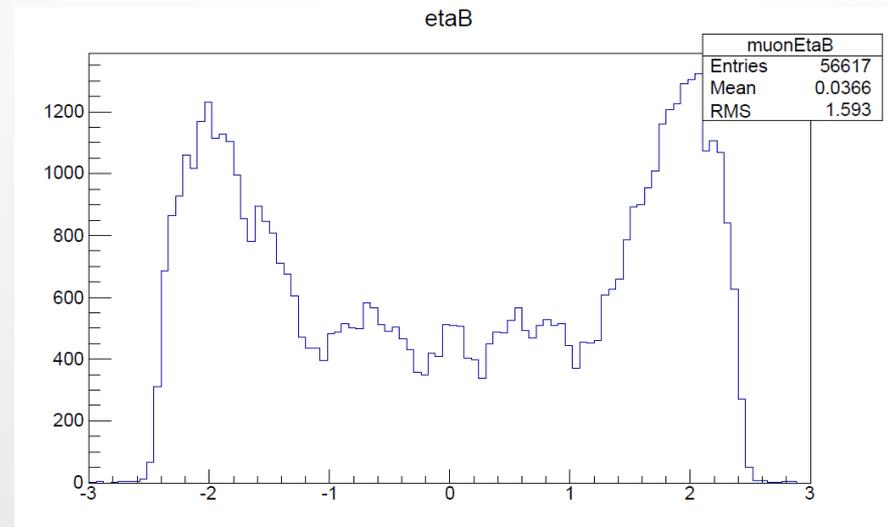

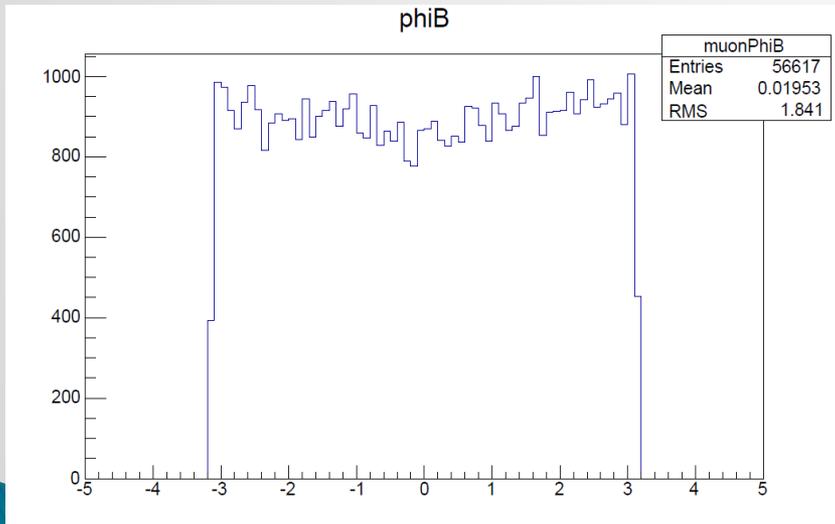

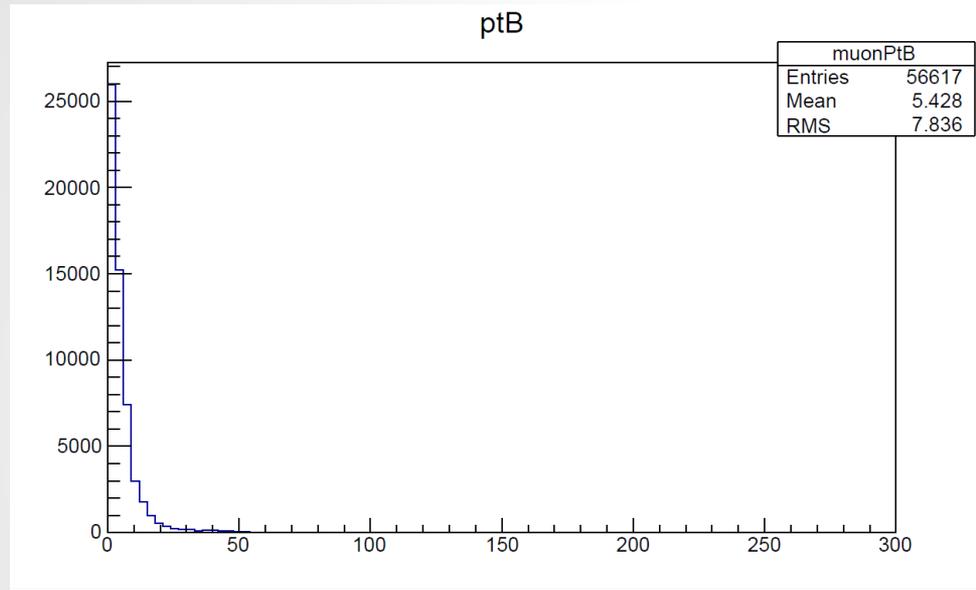

- ▶ Fermion compositeness models aim at reducing the number of fundamental matter constituents by describing **SM fermions** as bound states of more-elementary particles.
- ▶ Search of excited lepton in **4-muons** final state is done by using **pp collision** data collected in 2012. The integrated luminosity is  $19.\text{fb}^{-1}$ , with center of mass energy  $8\text{ TeV}$ .
- ▶ **4-muons** final state gives out **less** background.

- The concerned production of excited lepton always accompany with a **SM lepton** of same flavor and opposite-sign  $pp \rightarrow \mu\mu^*$  then decays by emitting a Z boson  $\mu^* \rightarrow \mu\mu Z$ , resulting 4-muons final state.

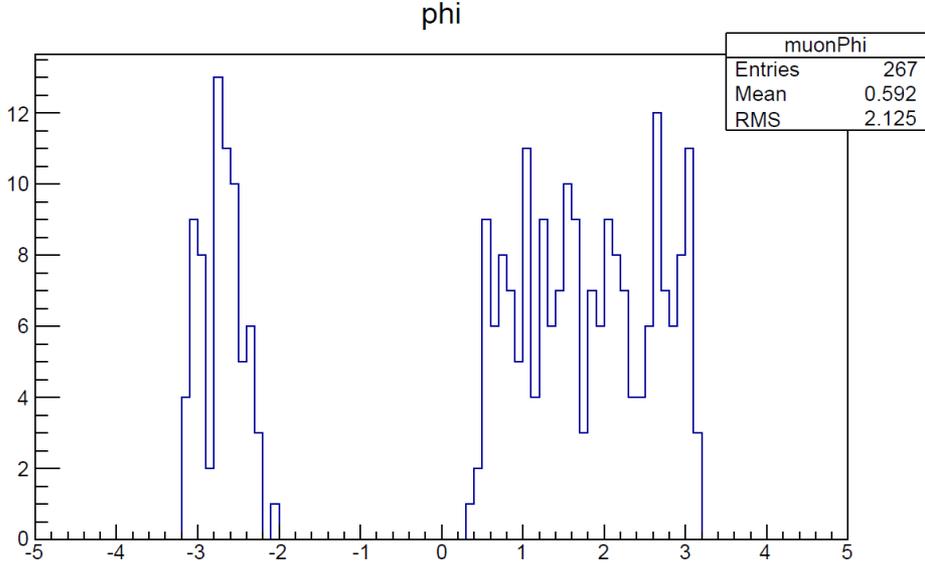

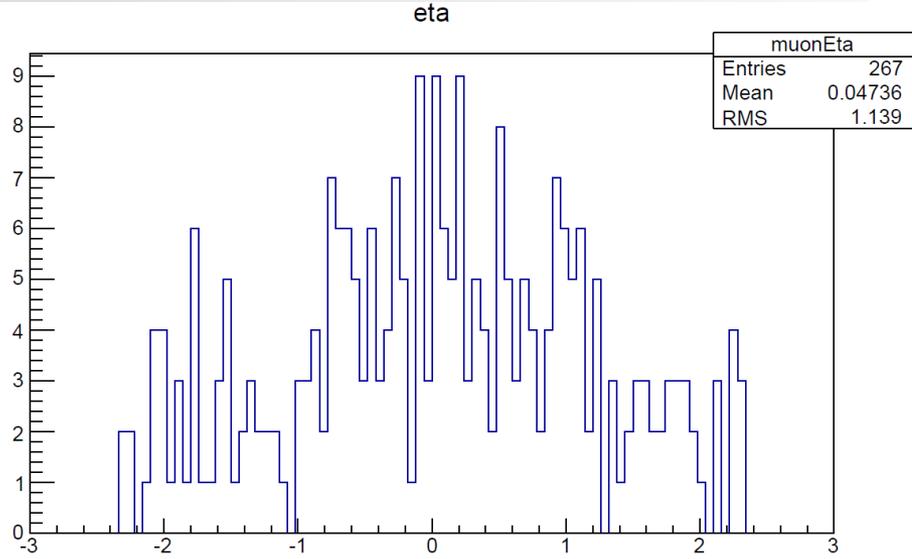

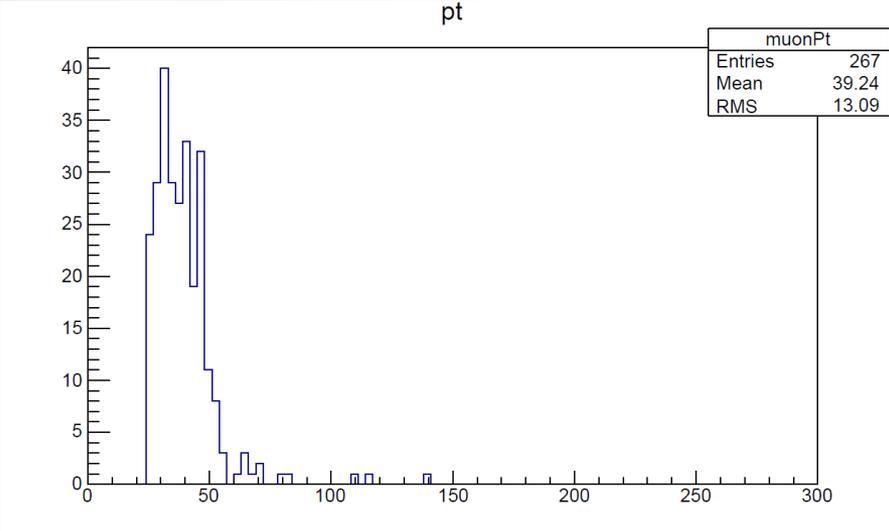

- The data was analyzed using the **CMS** release **CMSSW5314**, and **double muon** trigger.
- The three fundamental kinematic variables was plotted **before** the selection of muons:

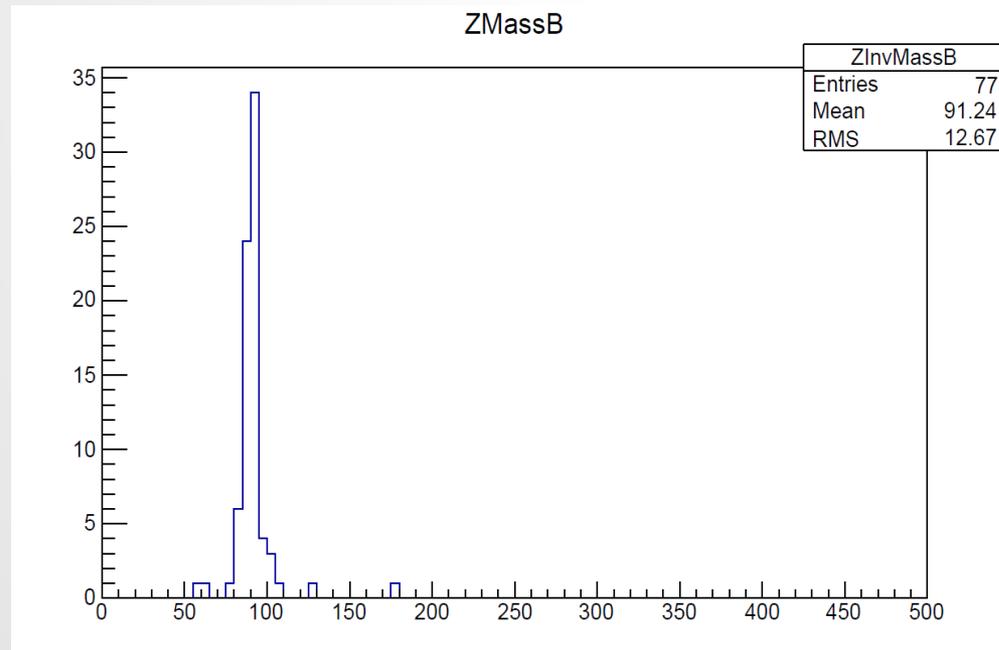

To select the muon, we use a slightly modified “High  $p_T$  ID” of the muon POG:

1. Acceptance: All four muons should have a  $p_T > 25$  GeV and  $|\eta| < 2.4$ .
2. Longitudinal distance with respect to primary vertex  $dz < 0.5$  cm.
3. Transverse impact parameter with respect to the primary vertex  $d_{xy} < 0.02$ .
4. Particle Flow based relative isolation in a cone of size  $\Delta(R) = 0.4 < 0.12$
5. Muon is a global muon.
6. Number of muon hits in the global track  $> 0$ .
7. At least two muon stations with segments.

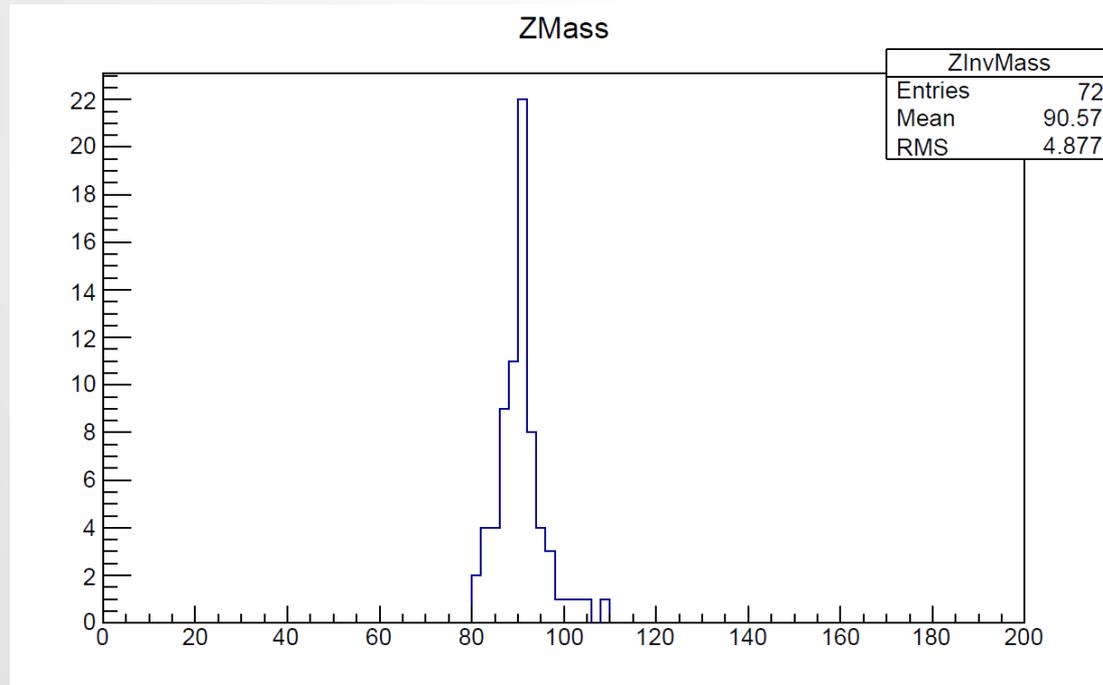

The three fundamental kinematical quantities after the selection of muon are:

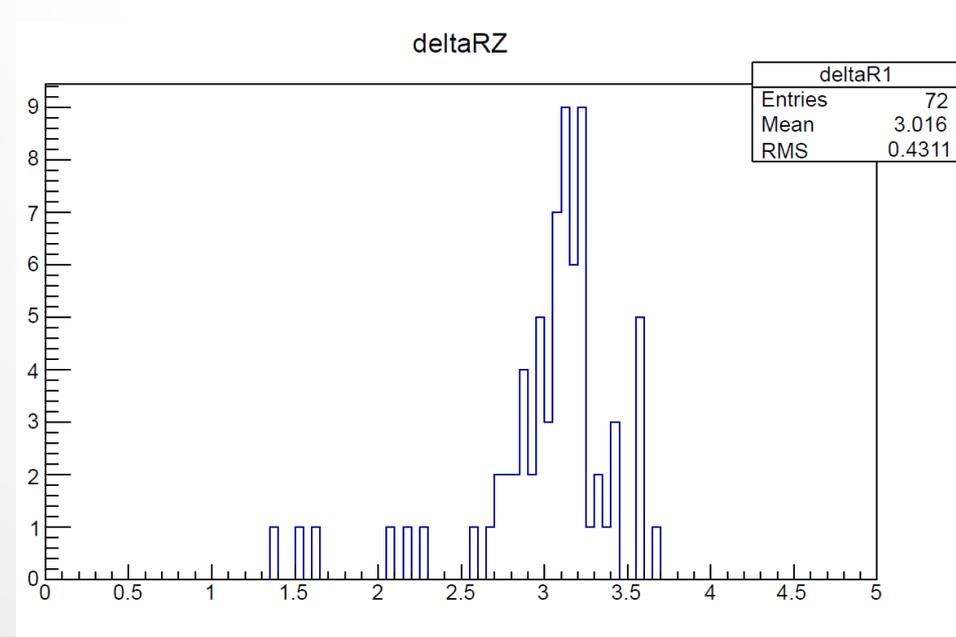

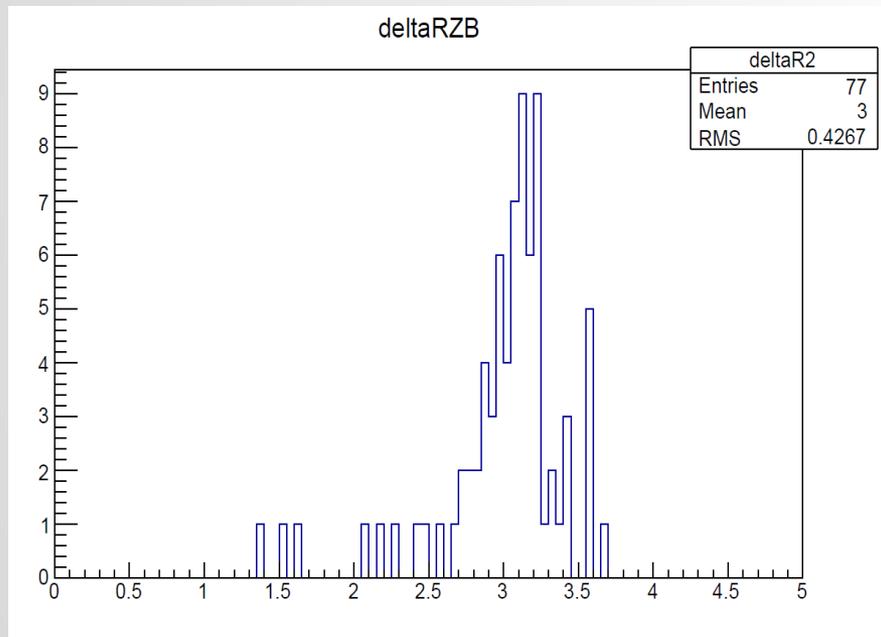

- ▶ The Z peak of the signal before invariant mass cut:

- ▶ The invariant mass cut of Z is a mass window 80–120 GeV, the Z peak after invariant mass cut:

- delta(R) of the two muons from the Z decay **before** (left), and **after** (right) invariant mass cuts:

## ▶ Current work status:

- 1) Phenomology of the contact interactions, and the compositeness model using the **LanHEP** package , and **CalcHEP**.
  - 2) Run the code on the background process that give rise to 4 muon final state, and calculating the pileup MC weighting, and efficiency.
  - 3) Optimize the code to run on the full dataset of 2012 (double muon trigger).
-
