Confinining properties of QCD in strong magnetic backgrounds

Friday 2 September 2016 15:00 (30 minutes)

Strong magnetic backgrounds are known to modify QCD properties at a non-perturbative level. We will discuss recent lattice results, obtained for $N_f = 2+1$ QCD with physical quark masses, concerning in particular the modifications and the anisotropies induced at the level of the static quark-antiquark potential and of other confining properties of strong interactions.

Summary

Strong magnetic backgrounds are known to modify QCD properties at a non-perturbative level. We will discuss recent lattice results, obtained for $N_f = 2+1$ QCD with physical quark masses, concerning in particular the modifications and the anisotropies induced at the level of the static quark-antiquark potential and of other confining properties of strong interactions.
