Initial state effects in small systems (pp,pA)

Tuesday, 30 August 2016 16:20 (30 minutes)

We discuss the importance of initial state effects with regard to the theoretical understanding of long range azimuthal correlations observed in high-multiplicity $p + p$ and $p + A$ collisions at RHIC and the LHC. Starting with a brief overview of different effects, we perform a systematic comparison of initial state calculations with experimental data and briefly discuss progress towards developing a unified picture of initial state and final state effects.
