The flow paradigm

Monday 29 August 2016 17:30 (30 minutes)

Soft particle production in ultrarelativistic heavy-ion collisions is surprisingly well described by the “flow paradigm” which states that particles are emitted independently, according to a one-particle probability distribution that fluctuates event to event. I review some consequences of this flow paradigm and show how it can be used to relate correlations of different orders.

Summary

Soft particle production in ultrarelativistic heavy-ion collisions is surprisingly well described by the “flow paradigm” which states that particles are emitted independently, according to a one-particle probability distribution that fluctuates event to event.

I review some consequences of this flow paradigm and show how it can be used to relate correlations of different orders.
