

SuperIso and flavor constraints on supersymmetric models

Tuesday 1 July 2008 11:35 (20 minutes)

SuperIso is a program dedicated to indirect constraint calculations in the MSSM, and in particular those associated to $b \rightarrow s \gamma$ transitions, providing for example the isospin asymmetry associated to these transitions at NLO accuracy and the branching ratio at NNLO. In this talk, I will present the most important features and the new developments of SuperIso, as well as some of the resulting constraints.

Presenter: Dr MAHMOUDI, Farvah Nazila (Mount Allison University)

Session Classification: Session 2
