

# Exploring the pPb ridge effect with CMS: Azimuthal correlations with identified hadrons and pseudorapidity dependence

**Dávid Englert**

Wigner RCP, Eötvös University

for the CMS Collaboration

Zimányi School  
1-5. December 2014

# Two particle angular correlations

Perfect tool for examining:

- geometry of the particle production process
- the initial-state of the medium that is created in the collision.

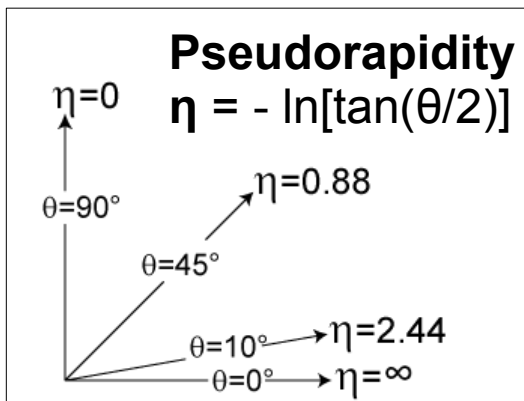

One of the techniques to extract single particle  $v_n$

CMS Experiment at LHC, CERN  
Data recorded: Mon Nov 8 11:30:53 2010 CEST  
Run/Event: 150431 / 630470

PbPb

PbPb event in CMS

$\theta$  – polar angle  
 $\Phi$  – azimuthal angle

(a) CMS PbPb  $\sqrt{s_{NN}} = 2.76$  TeV,  $220 \leq N_{trk}^{offline} < 260$

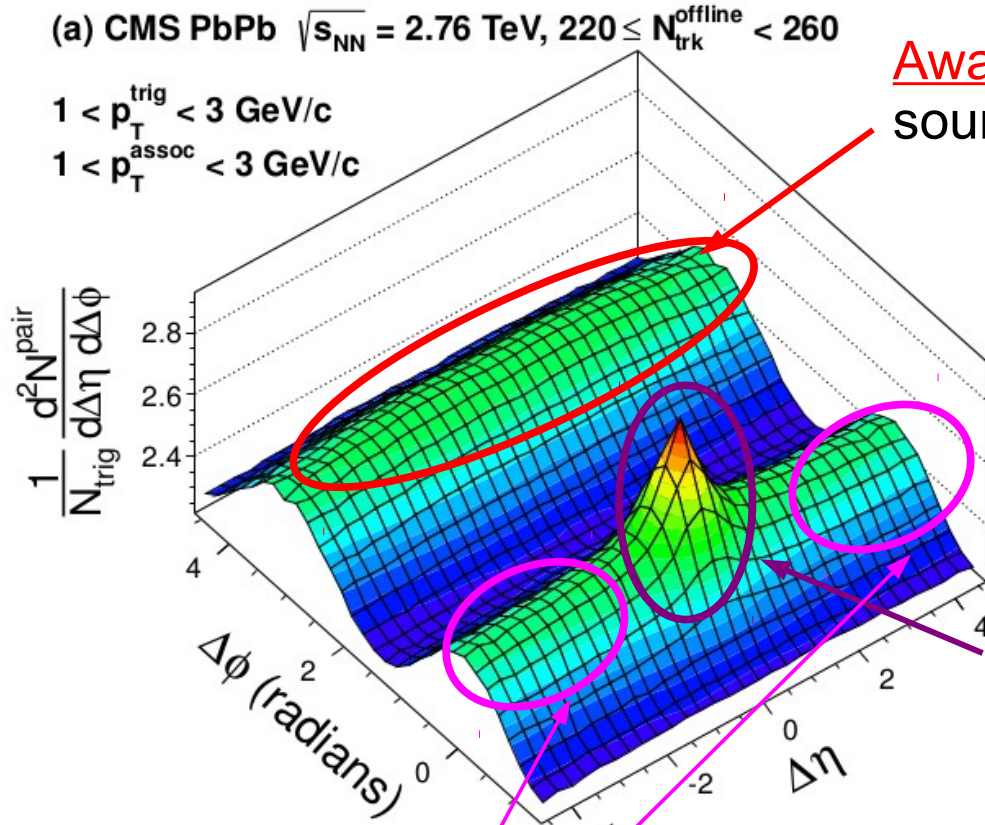

$1 < p_T^{trig} < 3$  GeV/c  
 $1 < p_T^{assoc} < 3$  GeV/c

dependence on  $\Delta\Phi$  and  $\Delta\eta$   
2D Correlation function

PLB 724 (2013) 213

# Understanding two particle angular correlations – specific regions and the physics behind it

Away side structure (wide  $\Delta\eta$ ,  $\Delta\Phi \sim \pi$ )

sources: - momentum conservation:  
 minijets, jets  
 - flow

Near side peak ( $\Delta\eta \sim 0$ ,  $\Delta\Phi \sim 0$ )

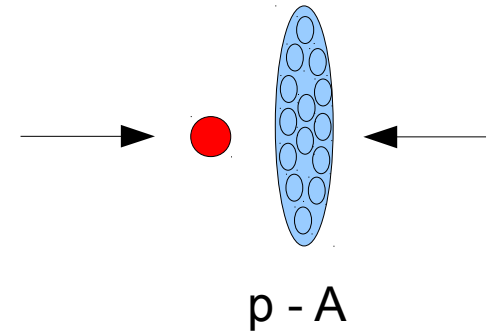

sources: - minijets, jets  
 - resonances  
 - quantum correlations

Near side ridge (wide  $\Delta\eta$ ,  $\Delta\Phi \sim 0$ )

sources: - flow  
 - ?

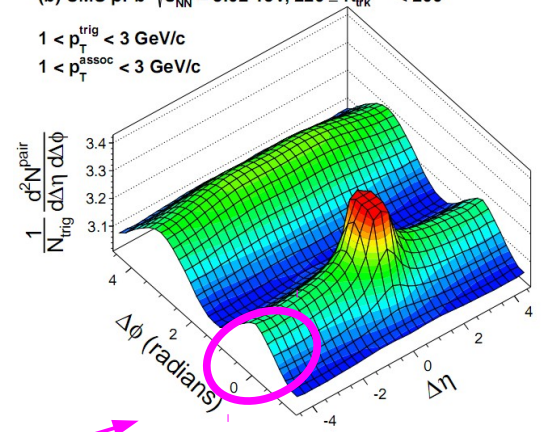

# Ridge effect in different collision systems

(a) CMS PbPb  $\sqrt{s_{NN}} = 2.76$  TeV,  $220 \leq N_{trk}^{offline} < 260$   
 $1 < p_T^{trig} < 3$  GeV/c  
 $1 < p_T^{assoc} < 3$  GeV/c

(d) CMS  $N \geq 110$ ,  $1.0 \text{ GeV}/c < p_T < 3.0 \text{ GeV}/c$

(b) CMS pPb  $\sqrt{s_{NN}} = 5.02$  TeV,  $220 \leq N_{trk}^{offline} < 260$   
 $1 < p_T^{trig} < 3$  GeV/c  
 $1 < p_T^{assoc} < 3$  GeV/c

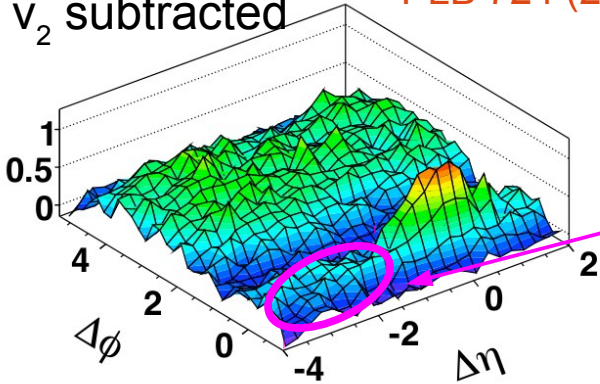

PLB 724 (2013) 213

JHEP 1009:091,2010

PLB 724 (2013) 213

$v_2$  subtracted

Near side ridge (wide  $\Delta\eta$ ,  $\Delta\Phi \sim 0$ )

Necessary: High multiplicity

Results from p-Pb & Pb-Pb are shown in this talk

(b) Au+Au 0-30% (PHOBOS)

Phys. Rev. Lett. 104, 062301

## Subdetectors used for flow studies

- Tracker  $|\Delta\eta|$  up to 5 (charged hadrons)
- HF (Event plane and centrality determination)

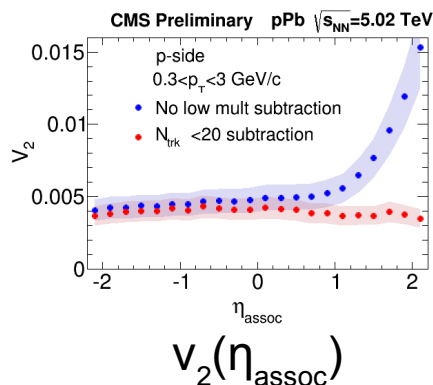

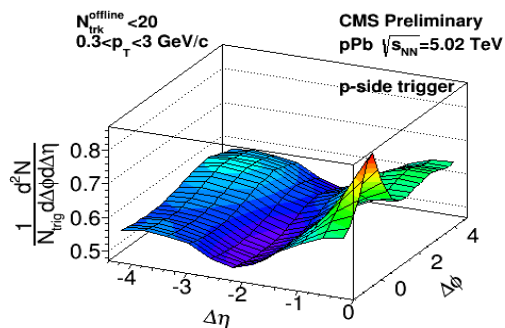

Full acceptance in  $\Phi$  and large acceptance in  $\eta$   
→ provides wide domain for correlation analysis

## Fixed trigger $\eta$ , unidentified charged particles

HIN-14-008

$$-2.4 < \eta_{trig} < -2.0$$

$$2.0 < \eta_{trig} < 2.4$$

### $\eta$ dependence of the ridge

Examining  $v_2(\eta)$  and  $v_3(\eta)$  anisotropy parameters.

## Integrated trigger $\eta$ , identified particles ( $K^0_s$ and $\Lambda$ )

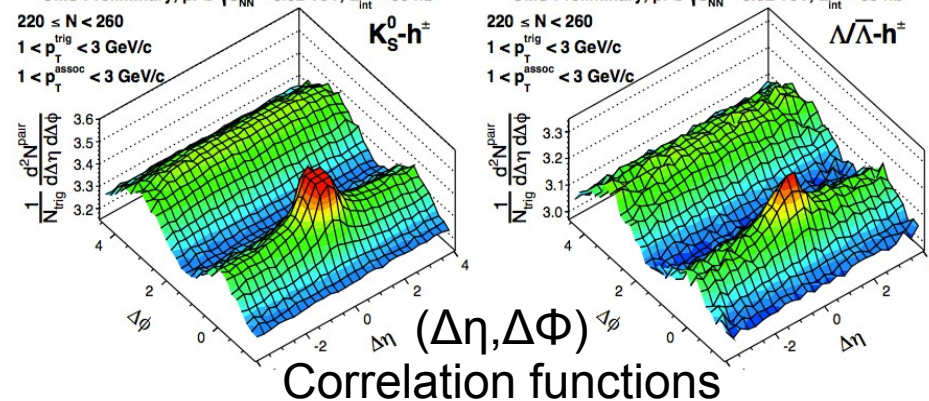

HIN-14-002

PID

CMS Preliminary, pPb  $\sqrt{s_{NN}} = 5.02$  TeV,  $L_{int} = 35$  nb $^{-1}$   
 $220 \leq N < 260$   
 $1 < p_T^{trig} < 3$  GeV/c  
 $1 < p_T^{assoc} < 3$  GeV/c

CMS Preliminary, pPb  $\sqrt{s_{NN}} = 5.02$  TeV,  $L_{int} = 35$  nb $^{-1}$   
 $220 \leq N < 260$   
 $1 < p_T^{trig} < 3$  GeV/c  
 $1 < p_T^{assoc} < 3$  GeV/c

### ( $K^0_s$ ) - (charged) and ( $\Lambda$ ) - (charged) correlations

Examining  $v_2$  and  $v_3$  anisotropy parameters: mass ordering,  $v_2$  crossing and quark number scaling

charged = all charged particles

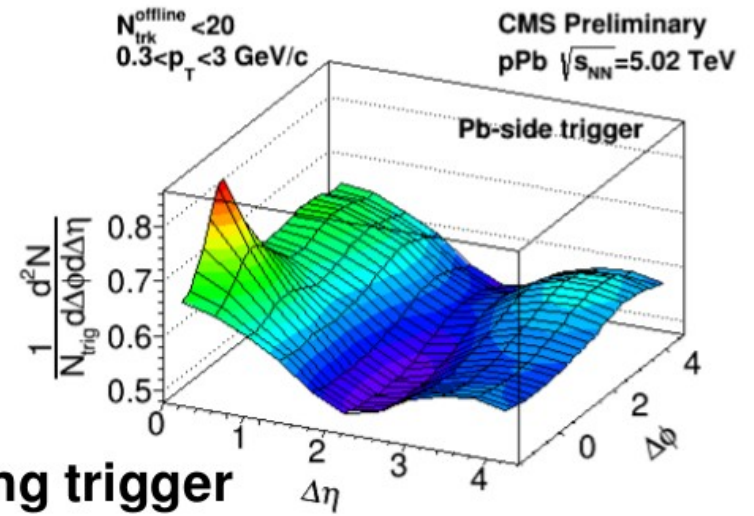

# Fixed trigger $\eta$ technique

Dihadron technique:  $\Delta\phi = \phi_{assoc} - \phi_{trig}, \Delta\eta = \eta_{assoc} - \eta_{trig}$

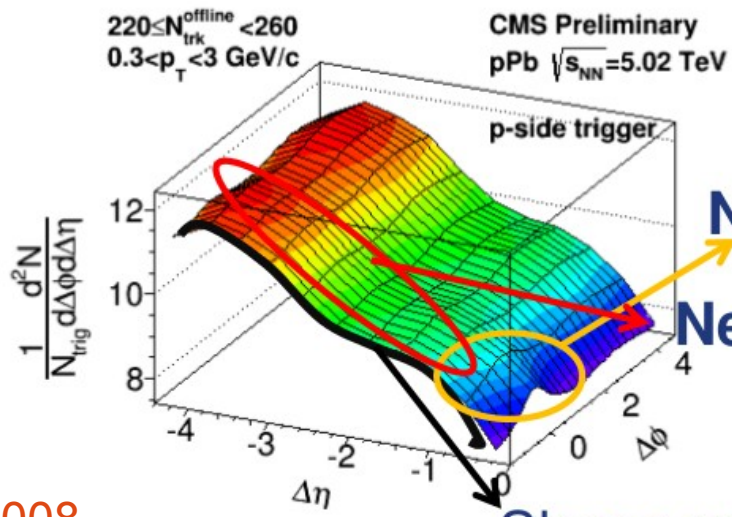

Not divided by mixed events:  $S(\Delta\eta, \Delta\phi) = \frac{1}{N_{trig}} \frac{d^2 N^{same}}{d\Delta\eta d\Delta\phi}$

**p-going trigger**

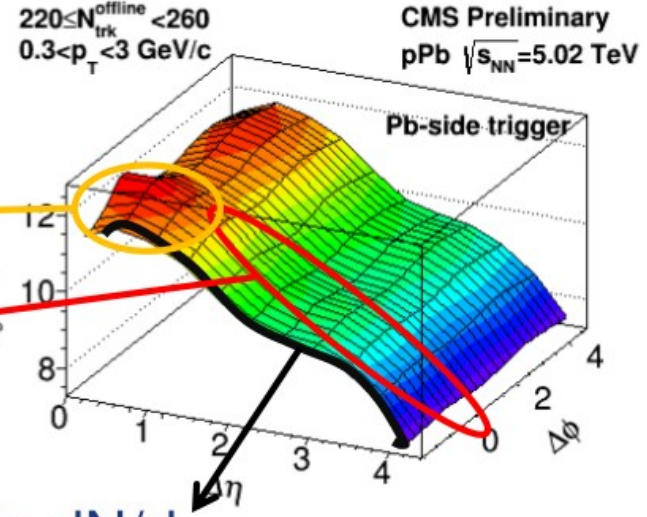

**Pb-going trigger**

**Near-side jet**

**Near-side ridge**

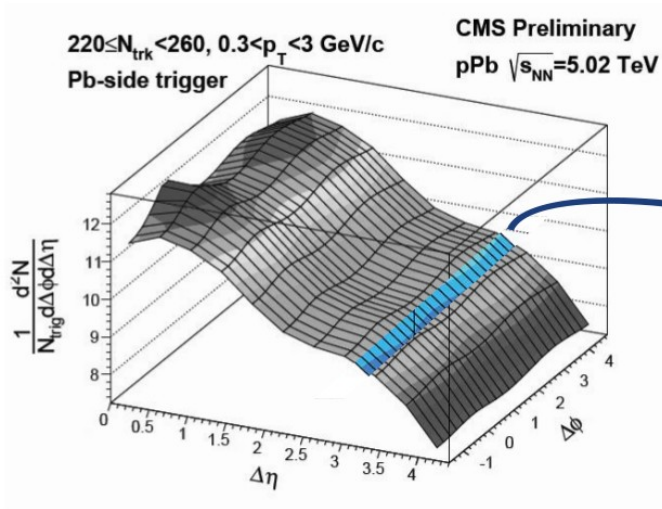

Shape reflects single particle  $dN/d\eta$

HIN-14-008

# ZYAM method

- For each  $\Delta\eta$  slice, step through the  $\Delta\phi$  range with  $\Delta\phi$  width of 0.26 to find the minimum value.
- After ZYAM subtraction, near-side yield is calculated by integrating over  $|\Delta\phi| < \pi/3$

Near-side yield  
 $|\Delta\phi| < \pi/3$

ZYAM value

HIN-14-008

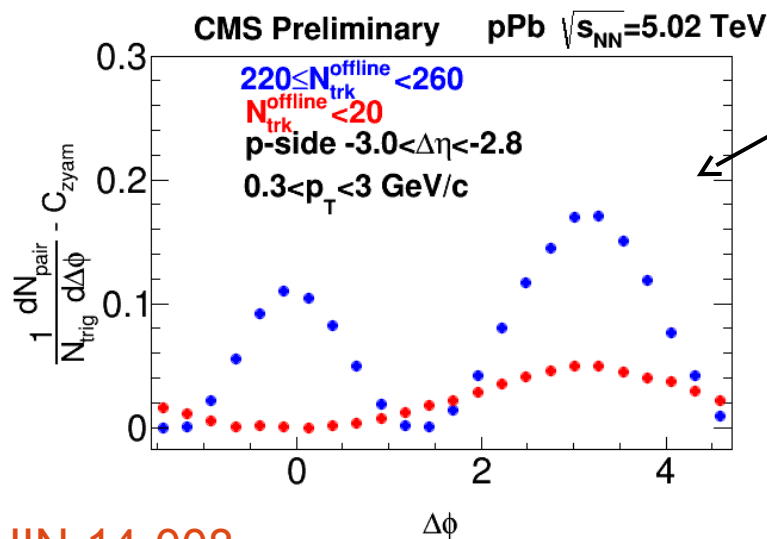

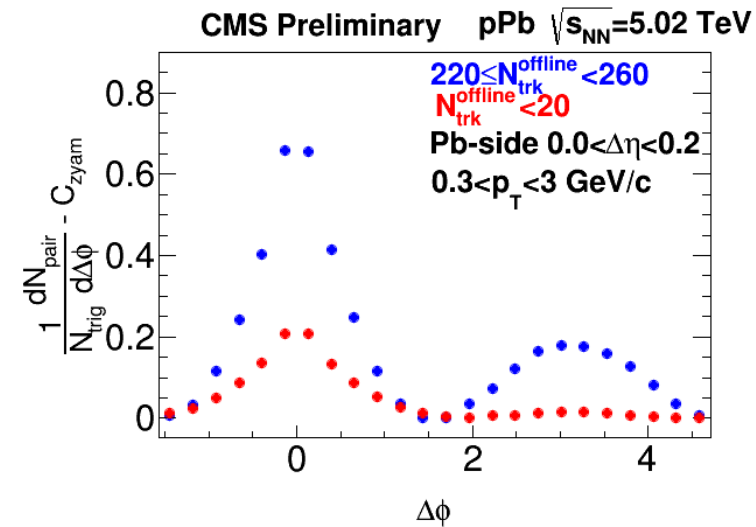

# $\Delta\Phi$ distribution of correlated yield after ZYAM subtraction

p-going trigger

Pb-going trigger

HIN-14-008

# Near-side jet and ridge decomposition

$\Delta\eta$  distribution  
of correlated yield  
after ZYAM subtraction  
 $|\Delta\phi| < \pi/3$

Use a fit function representing **jet** + **ridge** structure:

$$\frac{1}{N_{trig}} \frac{dN_{near}(\Delta\eta)}{d\Delta\eta} = \frac{Y\beta}{\sqrt{2\sigma}\Gamma(1/2\beta)} \exp\left[-\left(\frac{\Delta\eta^2}{2\sigma^2}\right)^\beta\right] + (C+k\Delta\eta) \times \text{ZYAM}(\Delta\eta)$$

Jet yield high-multiplicity/low-multiplicity ratio:

$$\frac{Y_{jet}(220 \leq N_{trk}^{offline} < 260)}{Y_{jet}(N_{trk}^{offline} < 20)} = \begin{cases} 3.08 \pm 0.11 \text{ (p-side trigger)} \\ 3.13 \pm 0.09 \text{ (Pb-side trigger)} \end{cases}$$

HIN-14-008

# Fourier coefficients $V_N$ from two-particle angular correlations

Fourier decomposition:

$$\frac{1}{N_{trig}} \frac{dN^{pair}}{d\Delta\phi} = \frac{N_{assoc}}{2\pi} \left\{ 1 + \sum_n 2V_n \cos(n \Delta\phi) \right\}$$

Factorization assumption:

$$V_n(\eta^{trig}, \eta^{assoc}) = v_n(\eta^{trig}) v_n(\eta^{assoc})$$

$$v_n(\eta^{assoc}) = \frac{V_n(\eta^{trig}, \eta^{assoc})}{v_n(\eta^{trig})}$$

$v_n(0)$  normalized anisotropy:

$$\frac{v_n(\eta^{assoc})}{v_n(0)} = \frac{V_n(\eta^{trig}, \eta^{assoc})}{V_n(\eta^{trig}, 0)}$$

$V_n$  two-particle anisotropy harmonic

$v_n$  single-particle anisotropy harmonic

Low-multiplicity subtraction to minimize jet contributions:

$$V_n^{sub} = V_n - V_n(N_{trk}^{offline} < 20) \times \frac{N_{assoc}(N_{trk}^{offline} < 20)}{N_{assoc}} \times \frac{Y_{jet}}{Y_{jet}(N_{trk}^{offline} < 20)}$$

# Fourier coefficients $V_n$ from two-particle correlations

**V<sub>2</sub>**

**Blue: no jet Subtraction**

**Red: with jet subtraction**

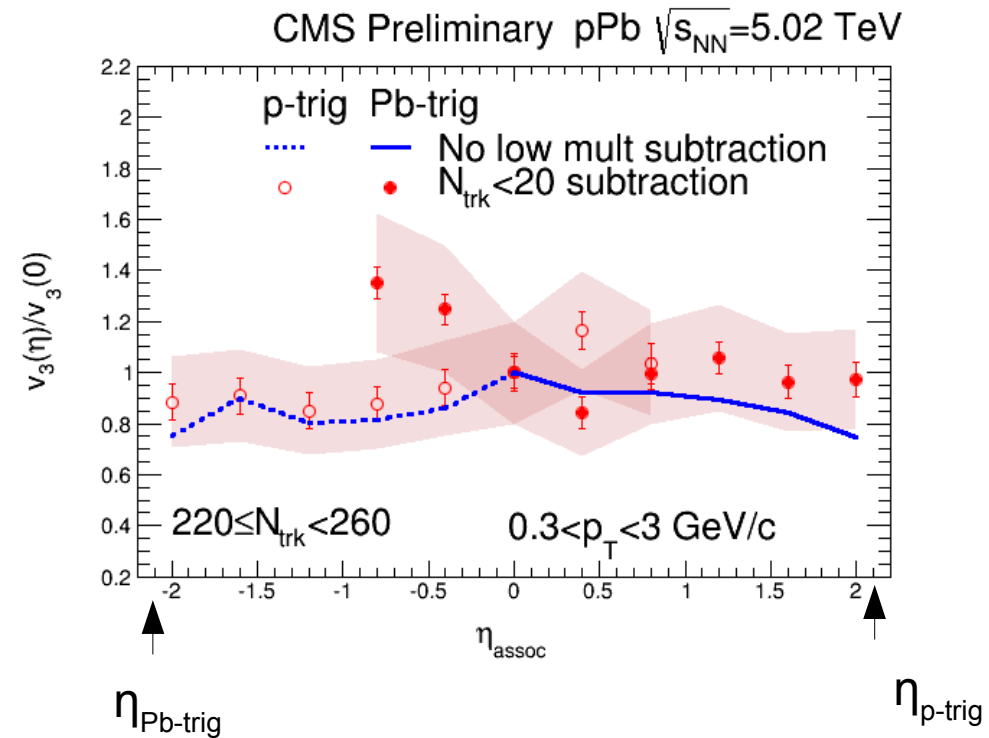

**V<sub>3</sub>**

HIN-14-008

# $v_n(0)$ normalized anisotropy = $v_n(\eta)/v_n(0)$

- $v_2$  shape is  $\eta$  dependent !
- $v_2$  from low-mult. subtraction: asymmetric about mid-rapidity
- With large errors, cannot draw conclusion for  $v_3$

HIN-14-008

# Moving to identified $K^0_s$ and $\Lambda$ and unidentified charged particle correlations with integrated $\eta$

# Extraction of the $v_2$ signal for $K_S^0$ and $\Lambda$

$K_S^0 \rightarrow \pi^+ + \pi^-$   $V^0$  reconstruction  
 $\Lambda(\bar{\Lambda}) \rightarrow p + \pi^- (\bar{p} + \pi^+)$  mass assumption

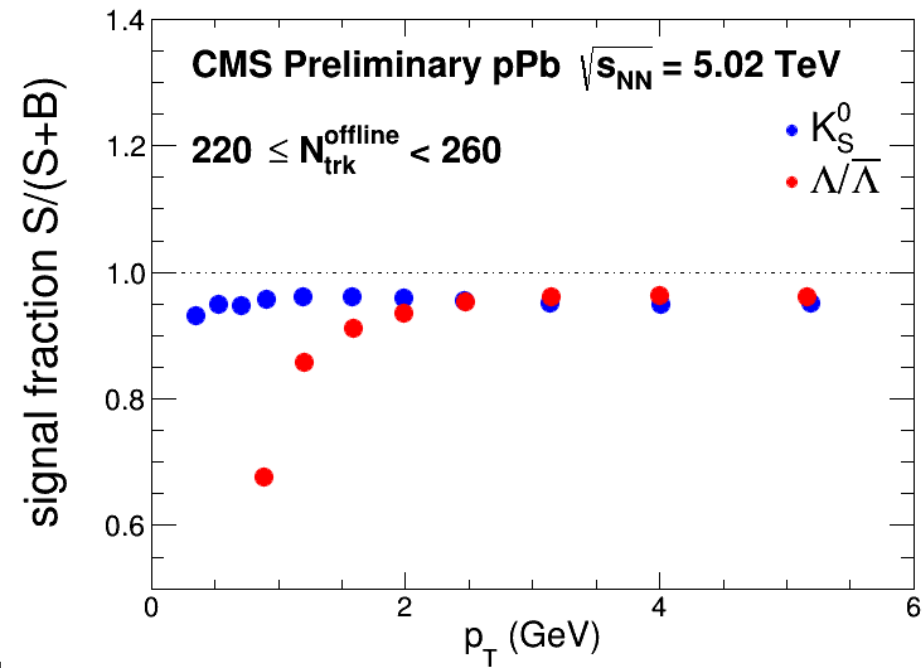

**Peak region:**  
 Background + signal candidates,  
 Extraction of  $v_n^{obs}$ ,  
 Calculation of signal fraction  
 $f = \text{signal yield} / \text{total yield} = S / (S+B)$

**Sideband background region:**  
 Only background candidates,  
 Extraction of  $v_n^{bkg}$

Sideband background region  $> -3\sigma$

$\pm 2\sigma$  Peak region  
HIN-14-002

Sideband background region  $> 3\sigma$

# Two-particle correlation function

CMS Preliminary, pPb  $\sqrt{s_{NN}} = 5.02$  TeV,  $L_{int} = 35$  nb $^{-1}$

$220 \leq N < 260$

$1 < p_T^{trig} < 3$  GeV/c

$1 < p_T^{assoc} < 3$  GeV/c

$K_S^0$ - $h^\pm$

$(K_S^0)$  – (charged) correlations  
 trigger associated

CMS Preliminary, pPb  $\sqrt{s_{NN}} = 5.02$  TeV,  $L_{int} = 35$  nb $^{-1}$

$220 \leq N < 260$

$1 < p_T^{trig} < 3$  GeV/c

$1 < p_T^{assoc} < 3$  GeV/c

$\Lambda/\bar{\Lambda}$ - $h^\pm$

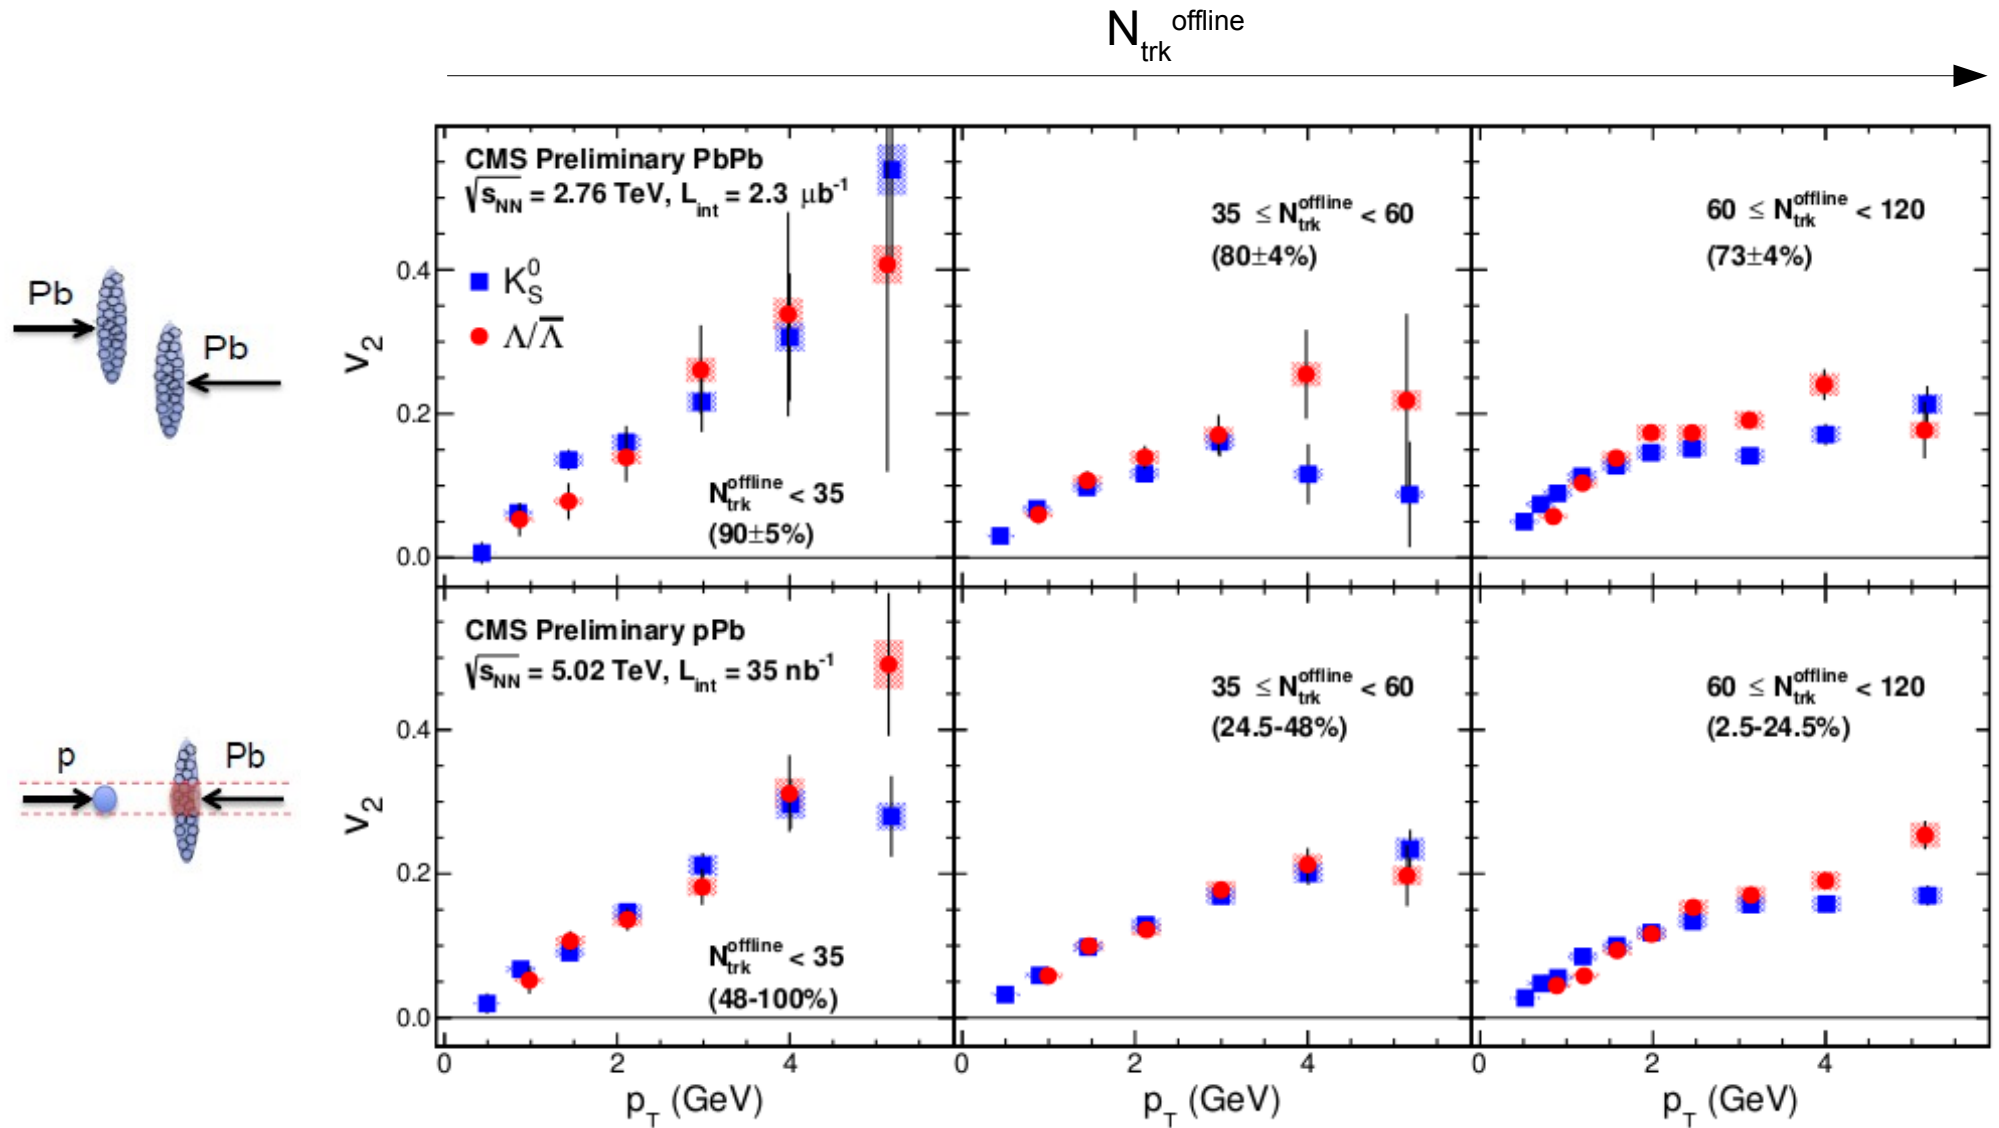

$(\Lambda)$  – (charged) correlations  
 trigger associated

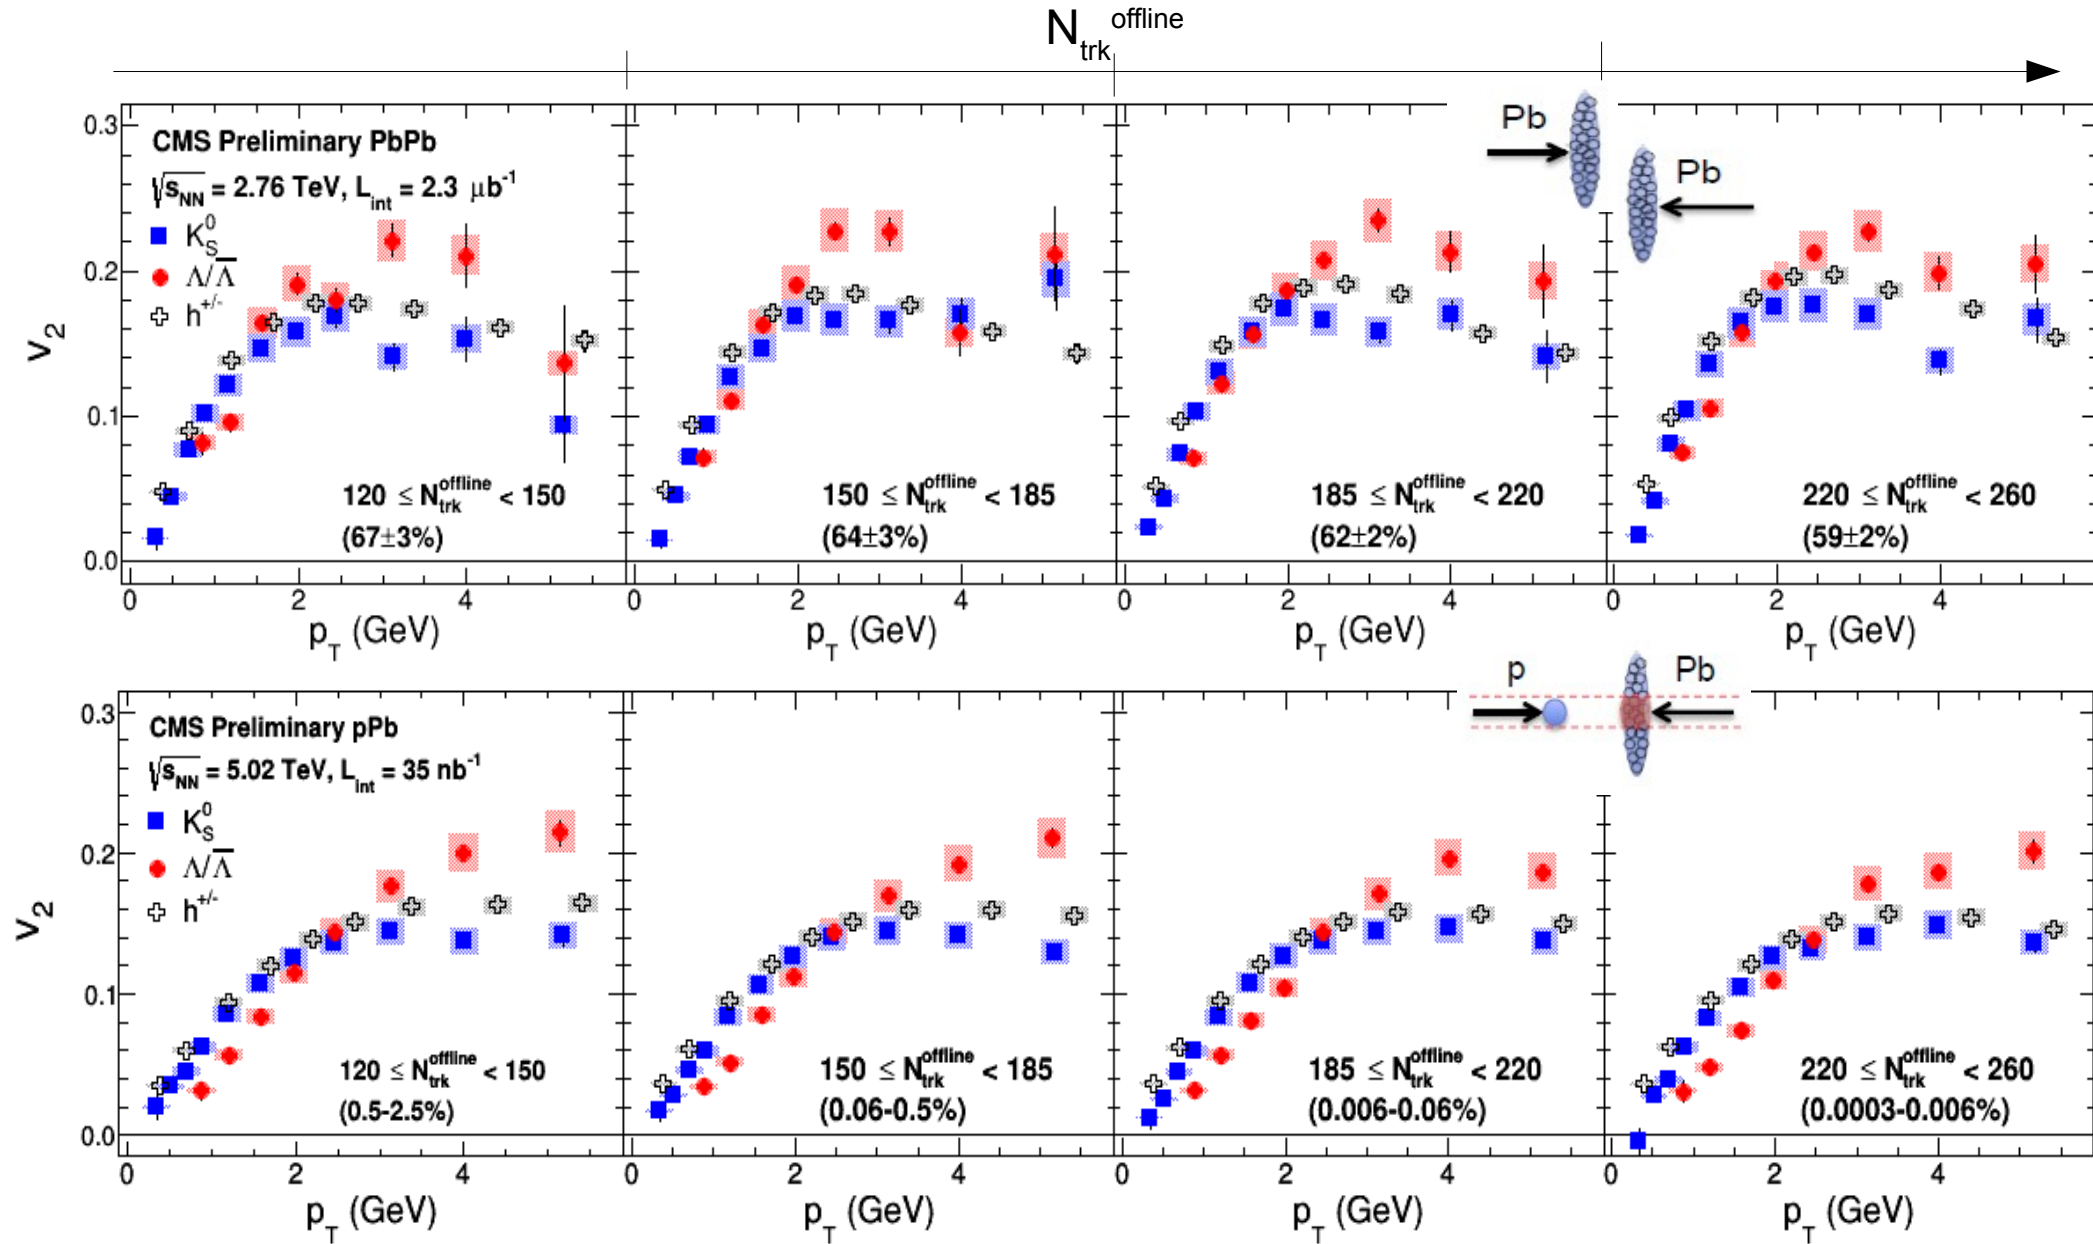

charged = all charged particles

# Low multiplicity: pPb and PbPb collisions

# Higher multiplicity class: pPb and PbPb collisions

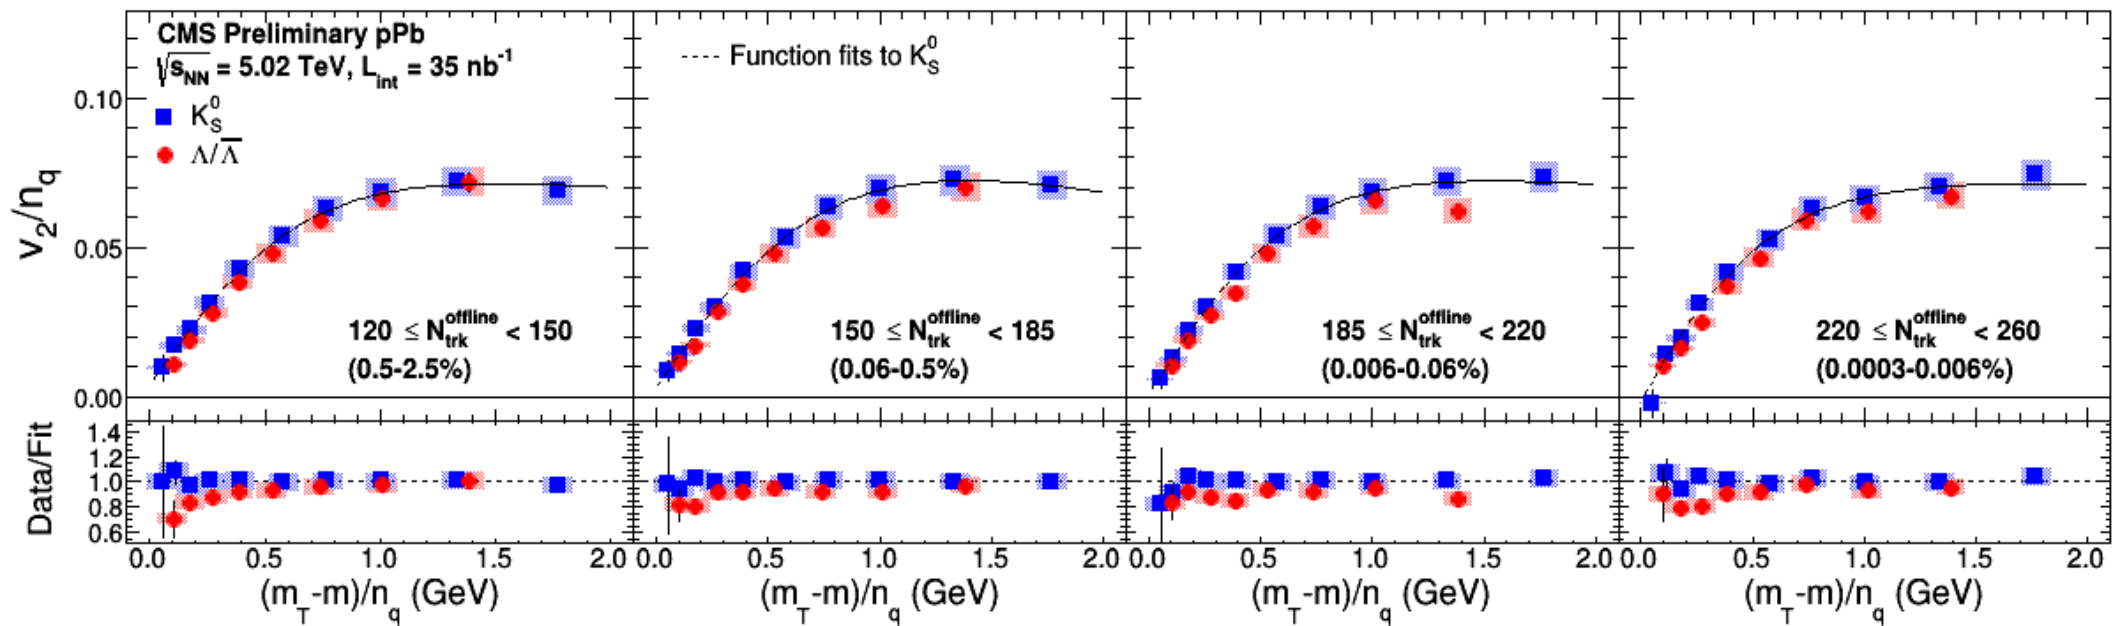

HIN-14-002

# NCQ scaling in high multiplicity pPb collisions

$N_{\text{trk}}^{\text{offline}}$

$$KE_T = m_T - m$$

$$m_T = \sqrt{m^2 + p_T^2}$$

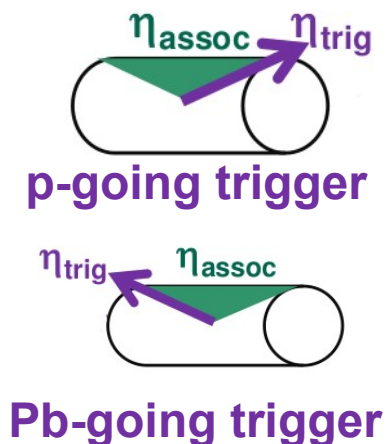

scaling holds better than 10% over most of the  $KE_T/n_q$  range, except for  $KE_T/n_q < 0.2 \text{ GeV}$  where the deviation grows to about 20%.

# $v_3$ in higher multiplicity

Cross-over (above  $\sim 2$  GeV/c) observed

## $\eta$ dependence of the ridge

HIN-14-008

- Ridge yield depends on  $\eta$
- Significant  $\eta$  dependence observed for  $v_2$

## $(K^0_s)$ - (charged) and $(\Lambda)$ - (charged) correlations

- Mass ordering  $v_2(\Lambda) < v_2(K^0_s)$ , is observed in pPb collisions and is more prominent compared to PbPb
- Approximate NCQ scaling of order 10% is observed for  $v_2$  in pPb collisions

**Thank you for your attention!**

## Near-side ridge after jet subtraction

Near-side ridge yield: different  $\eta$  dependences observed for **Pb-going trigger** and **p-going trigger**

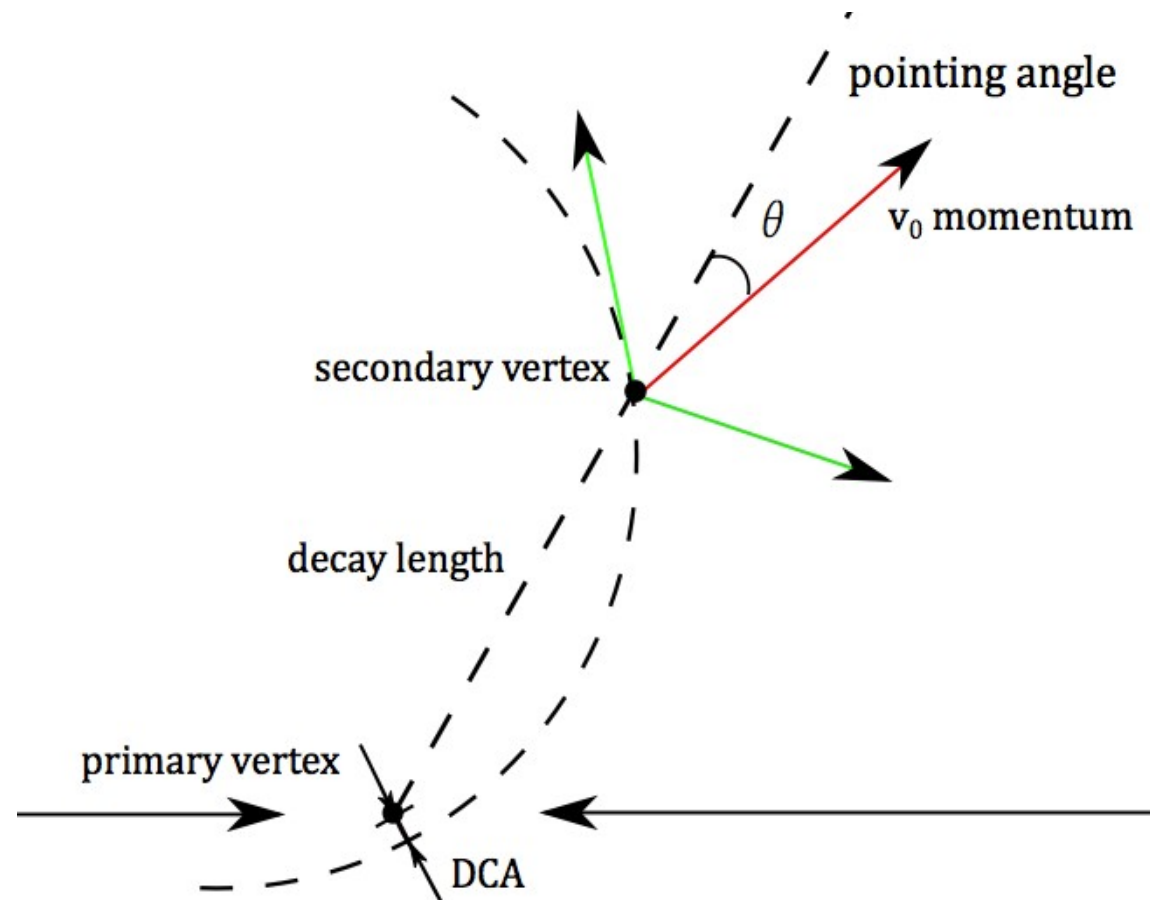

# Reconstructing $K_s^0$ and $\Lambda$ candidates

- The  $K_s^0$  and  $\Lambda$  candidates (referred to as  $V^0$ ) reconstructed by combining oppositely charged pairs of tracks which are detached from the primary vertex and form a good secondary vertex with an appropriate invariant mass.

- $K_s^0 \rightarrow \pi^+\pi^-$ ,  $c\tau = 2.68$  cm
- $\Lambda \rightarrow p^+\pi^-$ ,  $c\tau = 7.89$  cm
- $\text{Cos}(\theta_{\text{point}}) > 0.999$
- Distance-of-closest approach of  $V^0$  momentum vector and primary vertex  $< 0.5$  cm
- 3D separation between primary and  $V^0$  vertex  $> 5\sigma$

# Reconstructing $K_S^0$ and $\Lambda$ candidates

HIN-14-002

- Clean signal of  $K_S^0$  and  $\Lambda$  reconstructed over a wide range of  $p_T$  and  $\eta$
- Mass values very close to PDG numbers
