GridSite

Thursday 26 March 2009 08:00 (20 minutes)

We present an overview of the current status of the GridSite toolkit, describing the new security model for interactive and programmatic uses introduced in the last year. We discuss our experiences of implementing these internal changes and how they have been promoted by requirements from users and wider security trends in Grids (such as CSRF). Finally, we explain how these have improved the user experience of the GridPP website, and wider implications for portals.
