Quarkonium and heavy flavour production measurements at ATLAS

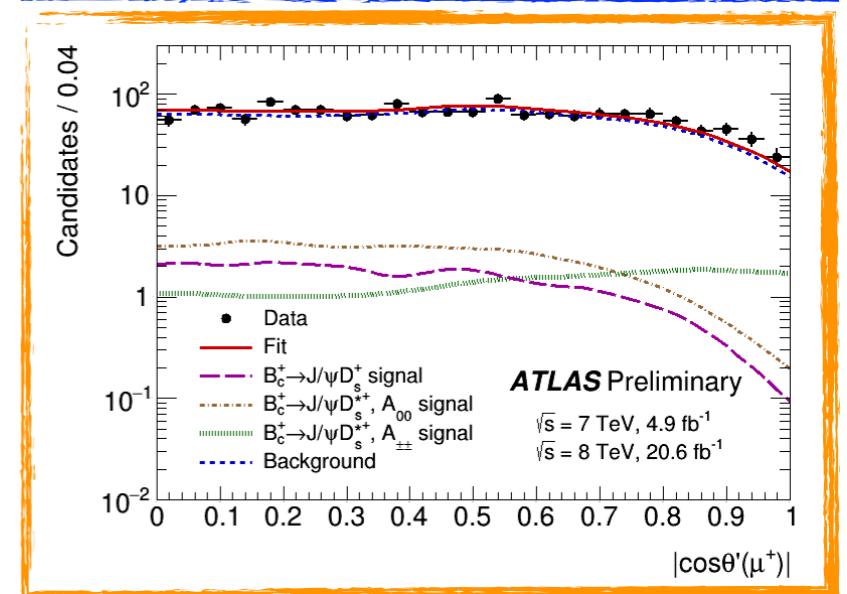

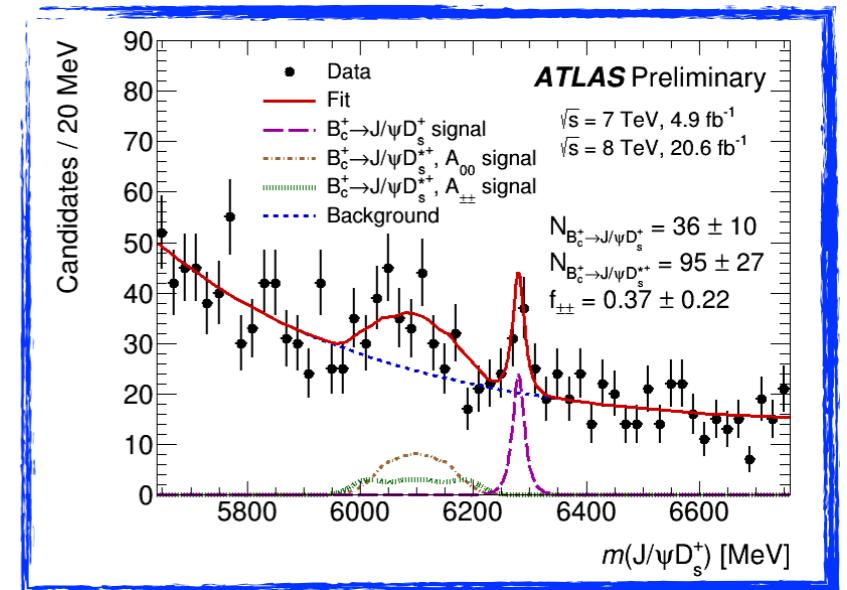

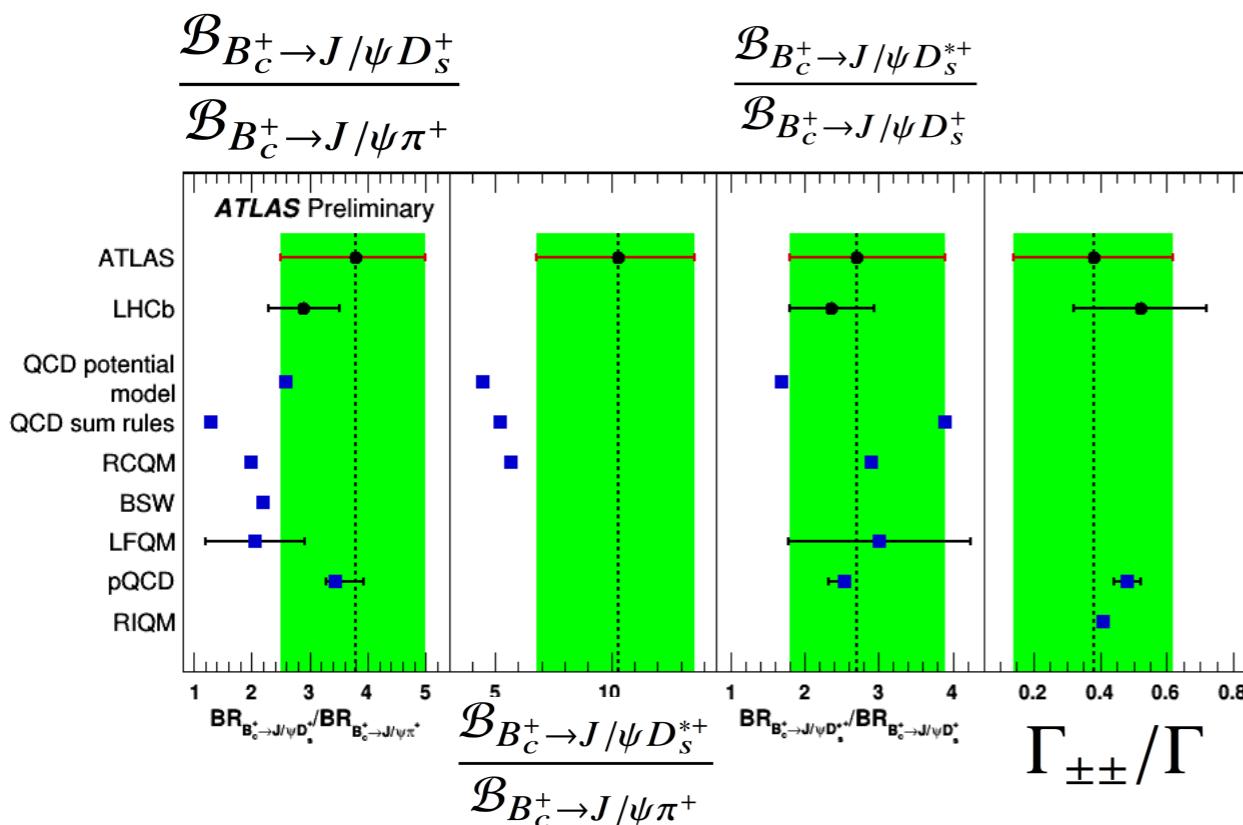

Introduction

✓	Associated production of prompt and non-prompt J/ ψ mesons and Z boson at $\sqrt{s} = 8\text{TeV}$	Eur. Phys. J. C75 (2015) 229
	Search for X_b and other hidden-beauty states using $\pi^+\pi^-Y(1S)$ channel	Phys. Lett. B 740 (2015) 199-217
	Cross-section measurement of $\psi(2S) \rightarrow J/\psi (\rightarrow \mu^+\mu^-) \pi^+\pi^-$ at $\sqrt{s} = 7\text{TeV}$	JHEP 09 (2014) 079
	ϕ_s and $\Delta\Gamma_s$ from flavour tagged time dependent angular analysis of $B_s^0 \rightarrow J/\psi \phi$	Phys. Rev. D 90 (2014) 052007
	Observation of an excited B_c^\pm meson state with the ATLAS detector	Phys. Rev. Lett. 113 (2014)
✓	Branching fractions of $B_c^+ \rightarrow J/\psi D_s^+$ and $B_c^+ \rightarrow J/\psi D_s^{*+}$ and transverse polarization fraction in the latter decay	ATLAS-CONF-2015-014
✓	Study of J/ψ and $\psi(2S)$ production in $\sqrt{s_{NN}} = 5.02\text{ TeV}$ p+Pb and $\sqrt{s} = 2.76\text{ TeV}$ pp collisions with the ATLAS detector	ATLAS-CONF-2015-023
✓	Differential cross-sections of prompt and non-prompt J/ψ and $\psi(2S)$ at $\sqrt{s} = 7$ and 8 TeV	ATLAS-CONF-2015-024
✓	Measurement of the differential non-prompt J/ψ production fraction in $\sqrt{s} = 13\text{ TeV}$ p p collisions at the ATLAS experiment	ATLAS-CONF-2015-030
✓	Observation of Λ_b in the decay $\Lambda_b^0 \rightarrow \psi(2S) \Lambda^0$	

Quarkonium and heavy flavour production measurements at ATLAS

Study of the $B_c^+ \rightarrow J/\psi D_s^+$ and $B_c^+ \rightarrow J/\psi D_s^{*+}$ decays

- B_c^+ consists of a b and c quark $\bar{b} \rightarrow \bar{c} c \bar{s}$ processes occur via
 - colour-allowed and colour-suppressed spectator diagrams
 - weak annihilation diagrams
- Study B_c^+ decay to $J/\psi D_s^+$ and $J/\psi D_s^{*+}$
 - $D_s^+ \rightarrow \phi \pi^+$ ($\phi \rightarrow K^+ K^-$)
 - $D_s^{*+} \rightarrow D_s^+ +$ soft photon or pion
- $B_c^+ \rightarrow J/\psi D_s^{*+}$
 - pseudoscalar meson to a pair of vector states transition
 - described by three helicity amplitudes
 - A_{++}, A_{--}, A_{00}

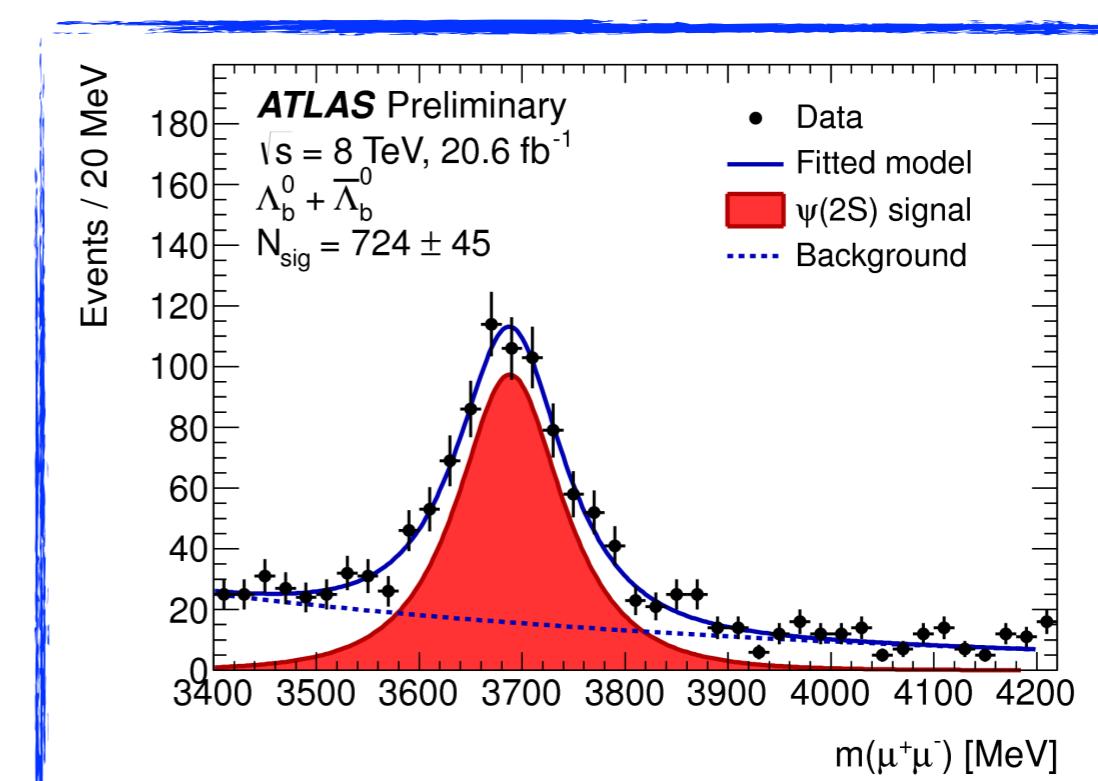

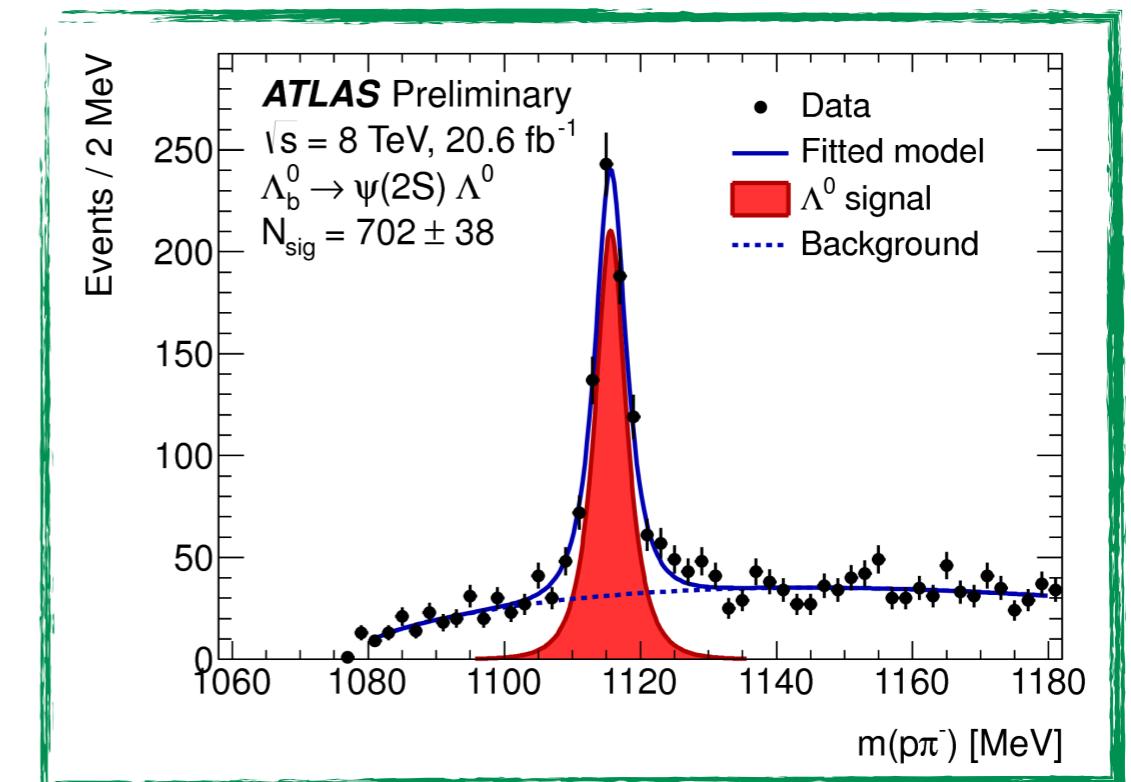

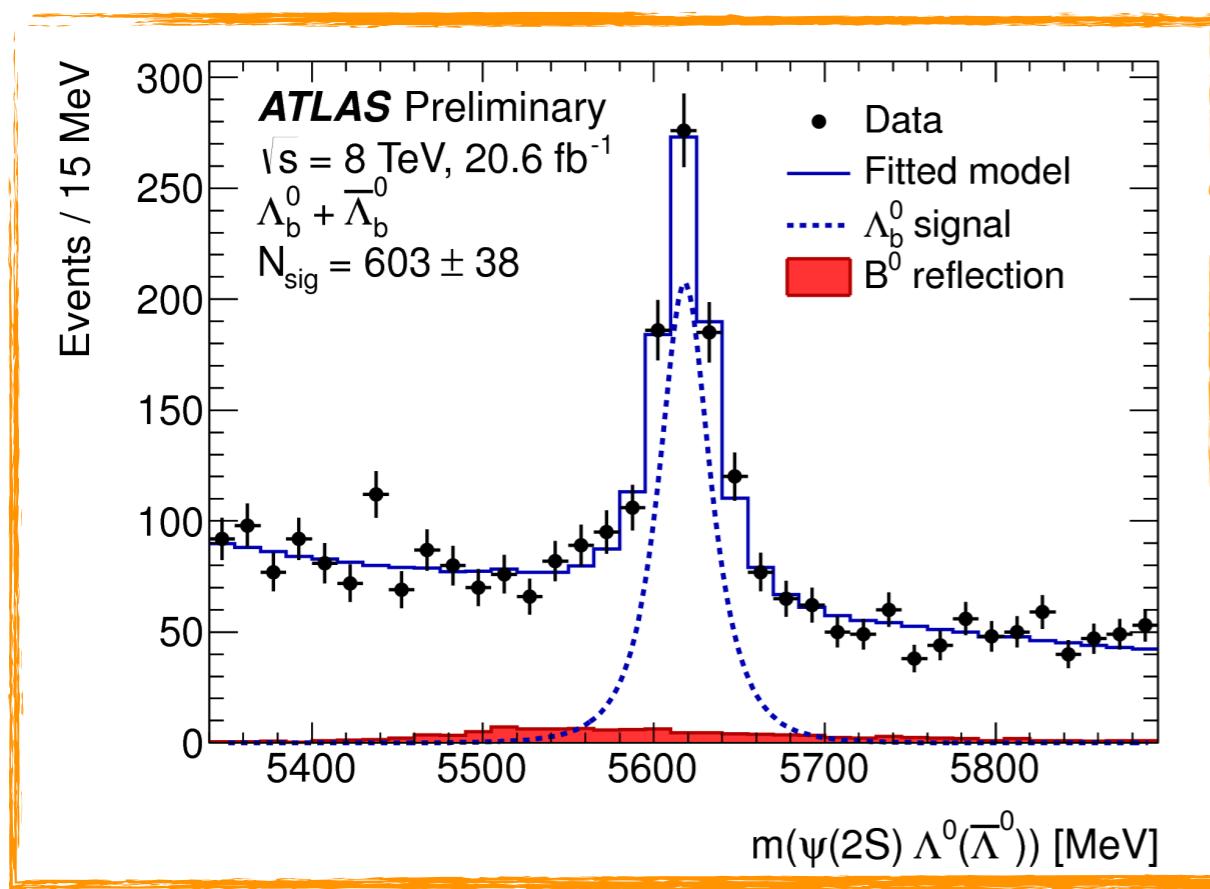

- Two dimensional extended unbinned ML fit
 - mass and helicity angle
- Both $\sqrt{s} = 7$ and 8 TeV data sets
 - 4.9 and 20.6 fb^{-1}
- Use an ensemble of single, di-muon and three-muon triggers

Quarkonium and heavy flavour production measurements at ATLAS

Observation of Λ_b^0 in the decay $\Lambda_b^0 \rightarrow \psi(2S) \Lambda^0$

- First observation of $\Lambda_b^0 \rightarrow \psi(2S) \Lambda^0$
- Measurement of branching ratio $\Gamma(\Lambda_b^0 \rightarrow \psi(2S) \Lambda^0) / \Gamma(\Lambda_b^0 \rightarrow J/\psi \Lambda^0)$
 - Λ^0 reconstructed in the di-muon mode
 - $\Lambda^0 \rightarrow p\pi^+$
 - $= 0.501 \pm 0.033 \text{ (stat.)} \pm 0.016 \text{ (syst.)} \pm 0.011 \text{ (B)}$
 - theory prediction: 0.8 ± 0.1
- $\sqrt{s} = 8 \text{ TeV}$ data set
 - 20.6 fb^{-1}

arXiv: link IF AVAILABLE

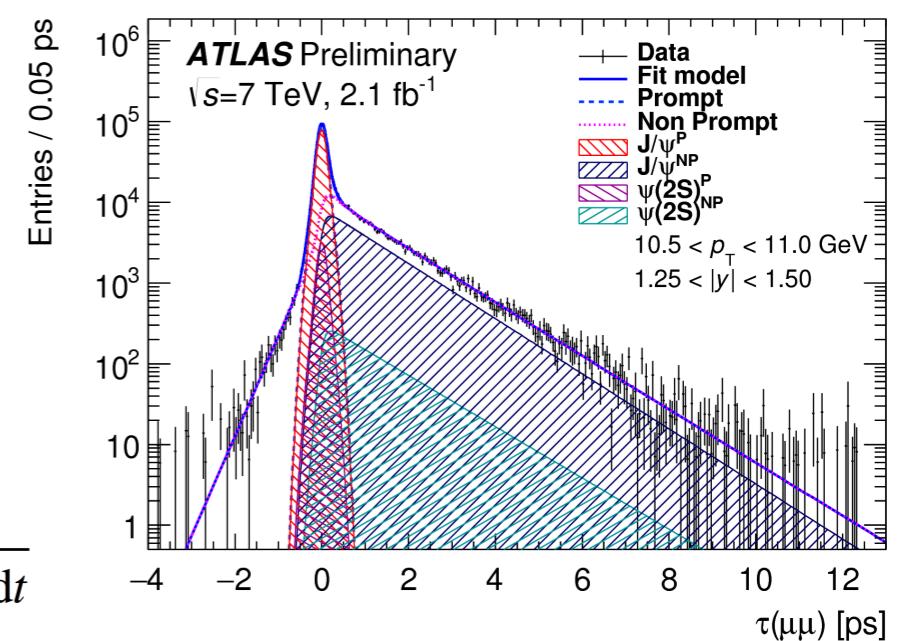

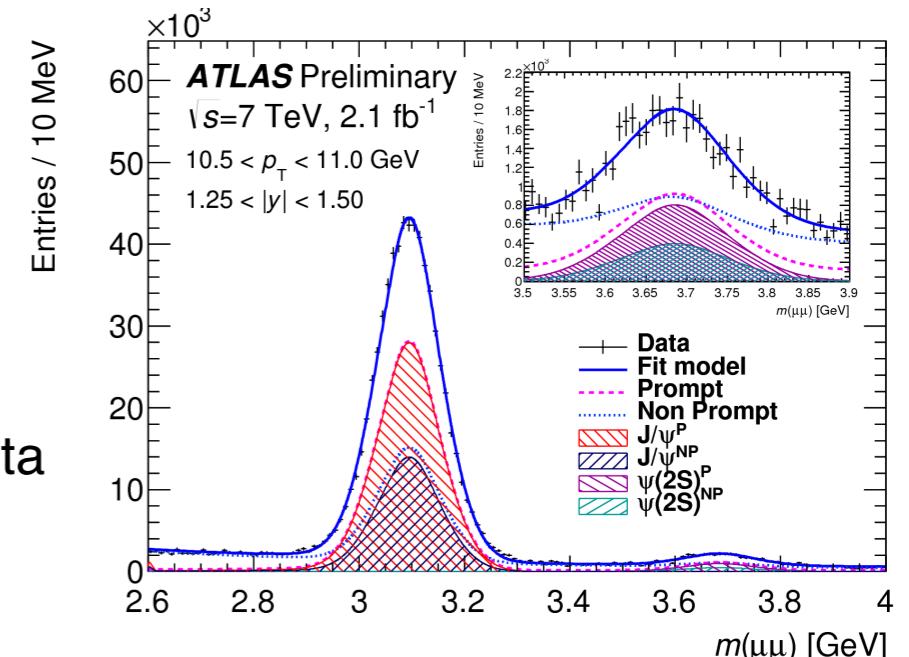

Quarkonium and heavy flavour production measurements at ATLAS

Prompt and non-prompt J/ψ and $\psi(2S)$ production at $\sqrt{s} = 2.76, 7$ and 8 TeV

- Quarkonia provide a unique opportunity to study QCD
- Hidden flavour presents significant challenges
 - theory and experiment
- Many theoretical models available
 - Colour Singlet Model
 - NNLO contributions calculated without introducing new phenomenological parameters
 - impossible to extend the calculation to P-wave states
 - Non-relativistic QCD (NRQCD)
 - parameters included, determined from fits to experimental data
 - good description of cross-sections - fail on polarisation
 - excuse me if your favourite one is not listed here
- Quarkonia are produced
 - QCD sources (prompt)
 - subsequent decays of b -hadrons (non-prompt)
 - $\psi(2S)$ has no significant feed-down from higher states
- 4 pb^{-1} of $\sqrt{s}=2.76 \text{ TeV}$, 2.1 fb^{-1} of $\sqrt{s}=7 \text{ TeV}$ and 11.4 fb^{-1} of $\sqrt{s}=8 \text{ TeV}$
- J/ψ and $\psi(2S)$ to di-muon final state
 - di-muon trigger
- Differential cross-section

$$\frac{d^2\sigma(pp \rightarrow \psi)}{dp_T dy} \times \mathcal{B}(\psi \rightarrow \mu^+ \mu^-) = \frac{N_\psi^p}{\Delta p_T \Delta y \times \int \mathcal{L} dt}$$

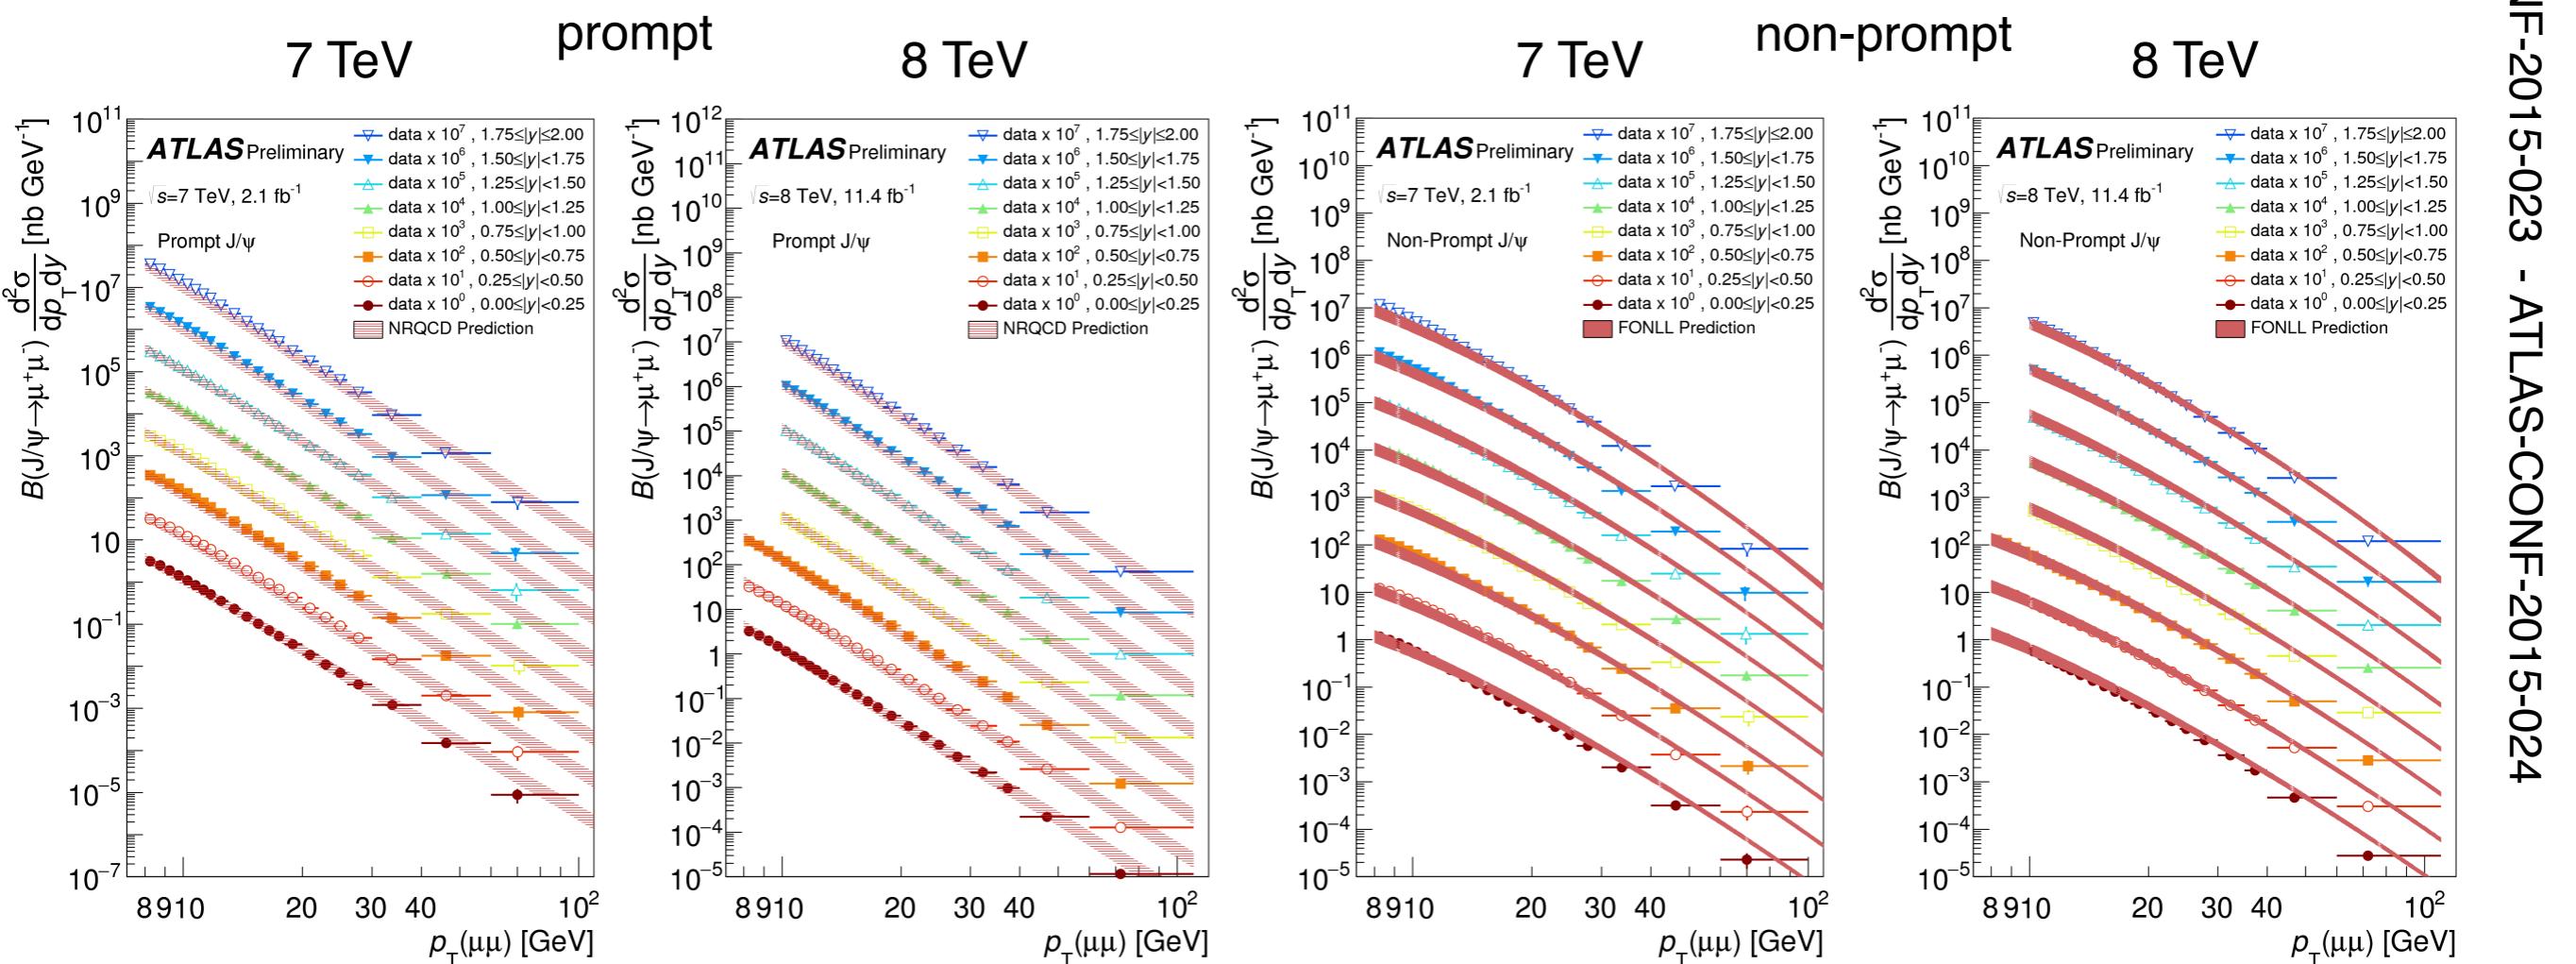

Two dimensional unbinned maximum likelihood fit to separate prompt and non-prompt component

Quarkonium and heavy flavour production measurements at ATLAS

Prompt and non-prompt J/ψ and $\psi(2S)$ production at $\sqrt{s} = 2.76, 7$ and 8 TeV

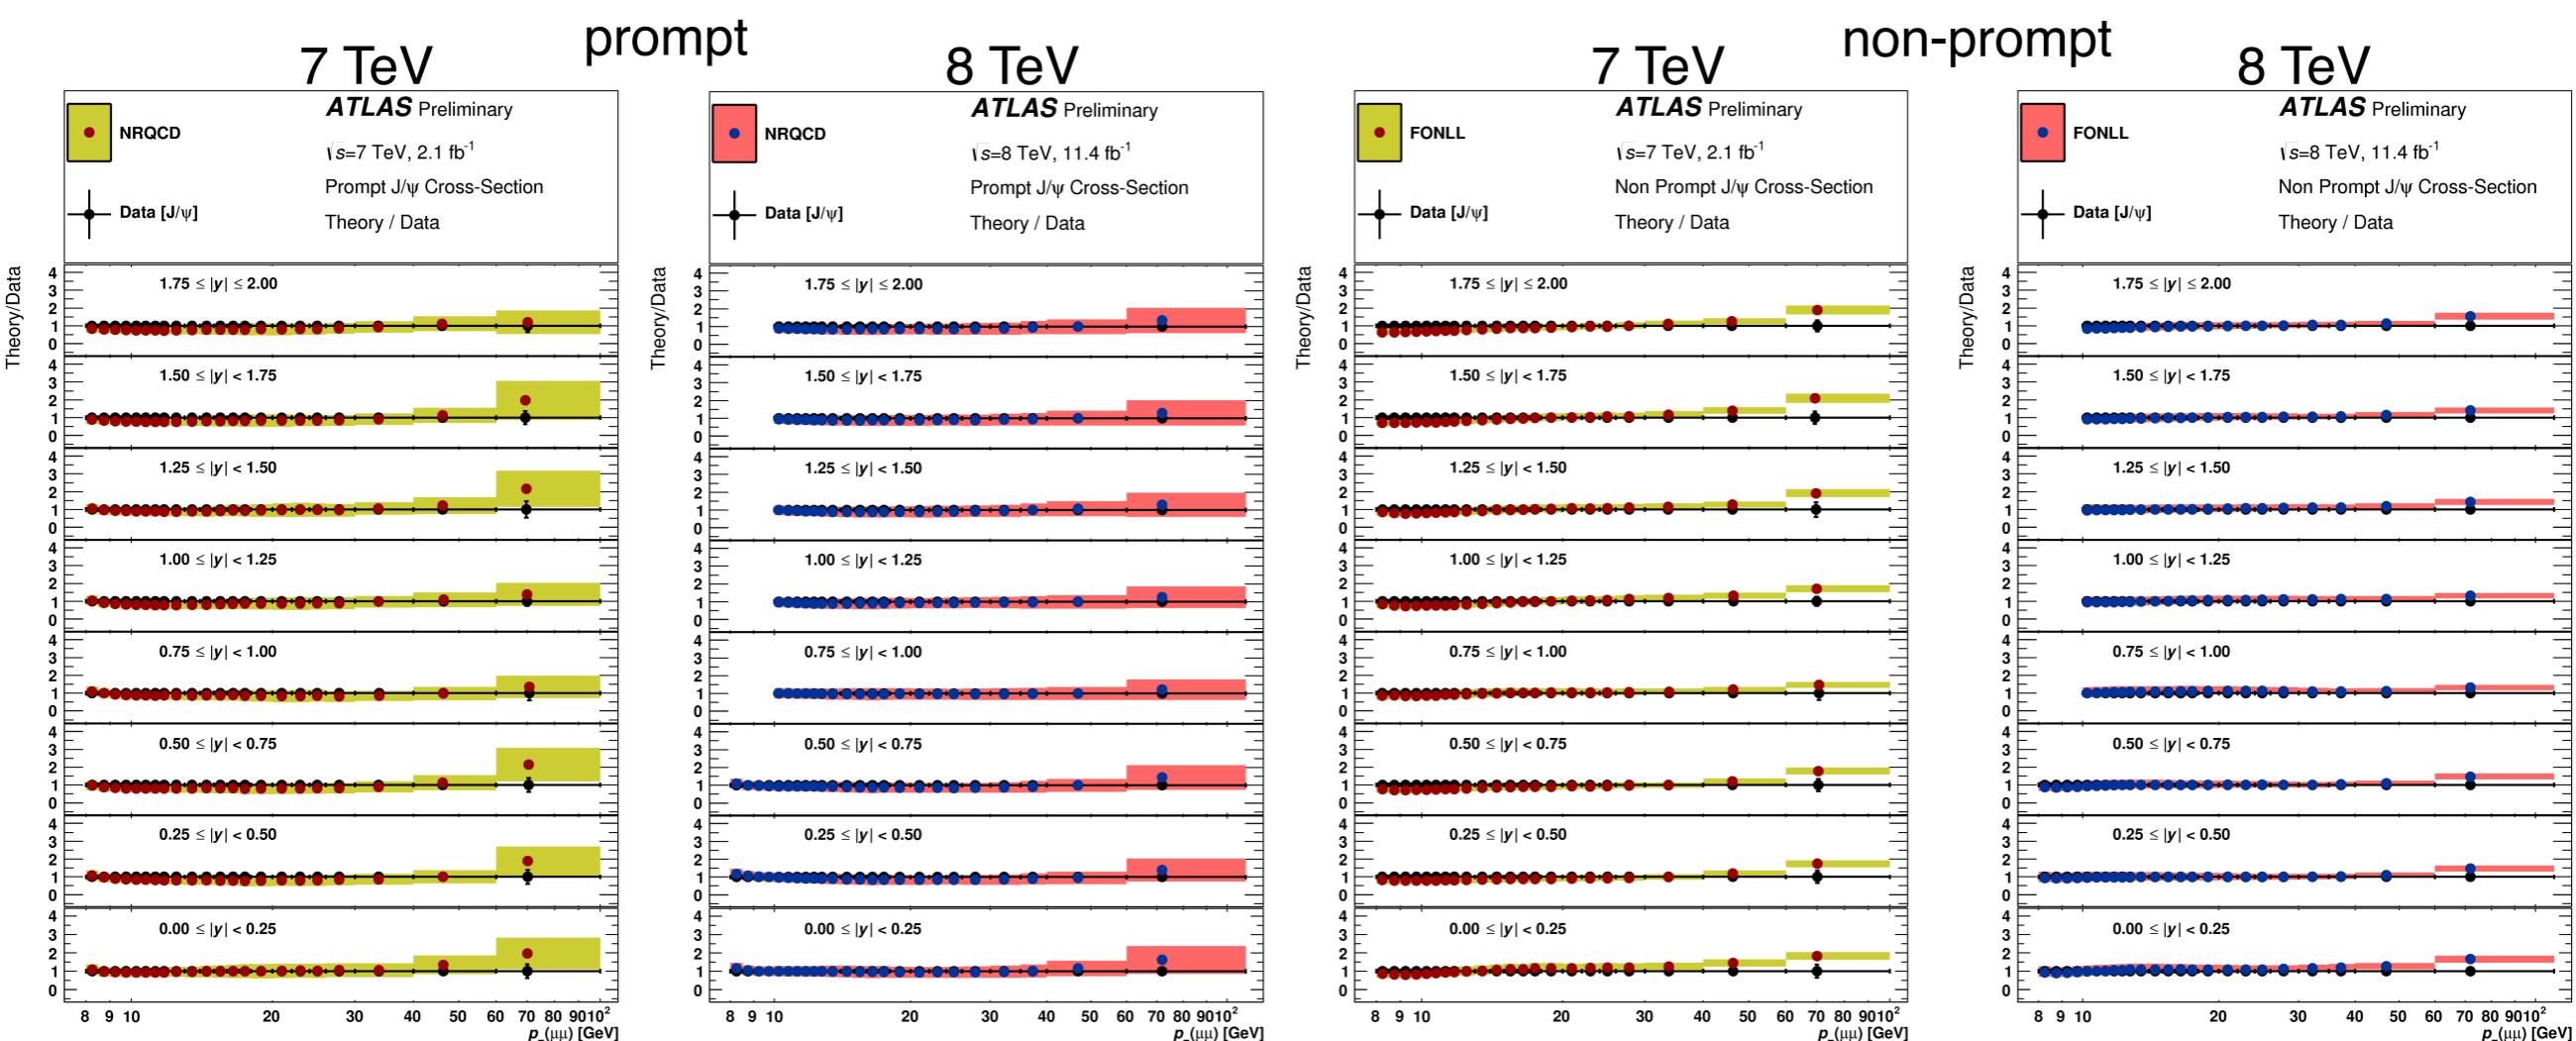

- Correcting for
 - trigger and reconstruction efficiencies
 - acceptance (depending on spin-alignment)
 - isotropic scenario considered for main result
- Double differential cross-section
 - 22 p_T bins: 8-110 GeV
 - 8 $|y|$ bins: 0-2

Quarkonium and heavy flavour production measurements at ATLAS

Prompt and non-prompt J/ψ and $\psi(2S)$ production at $\sqrt{s} = 2.76, 7$ and 8 TeV

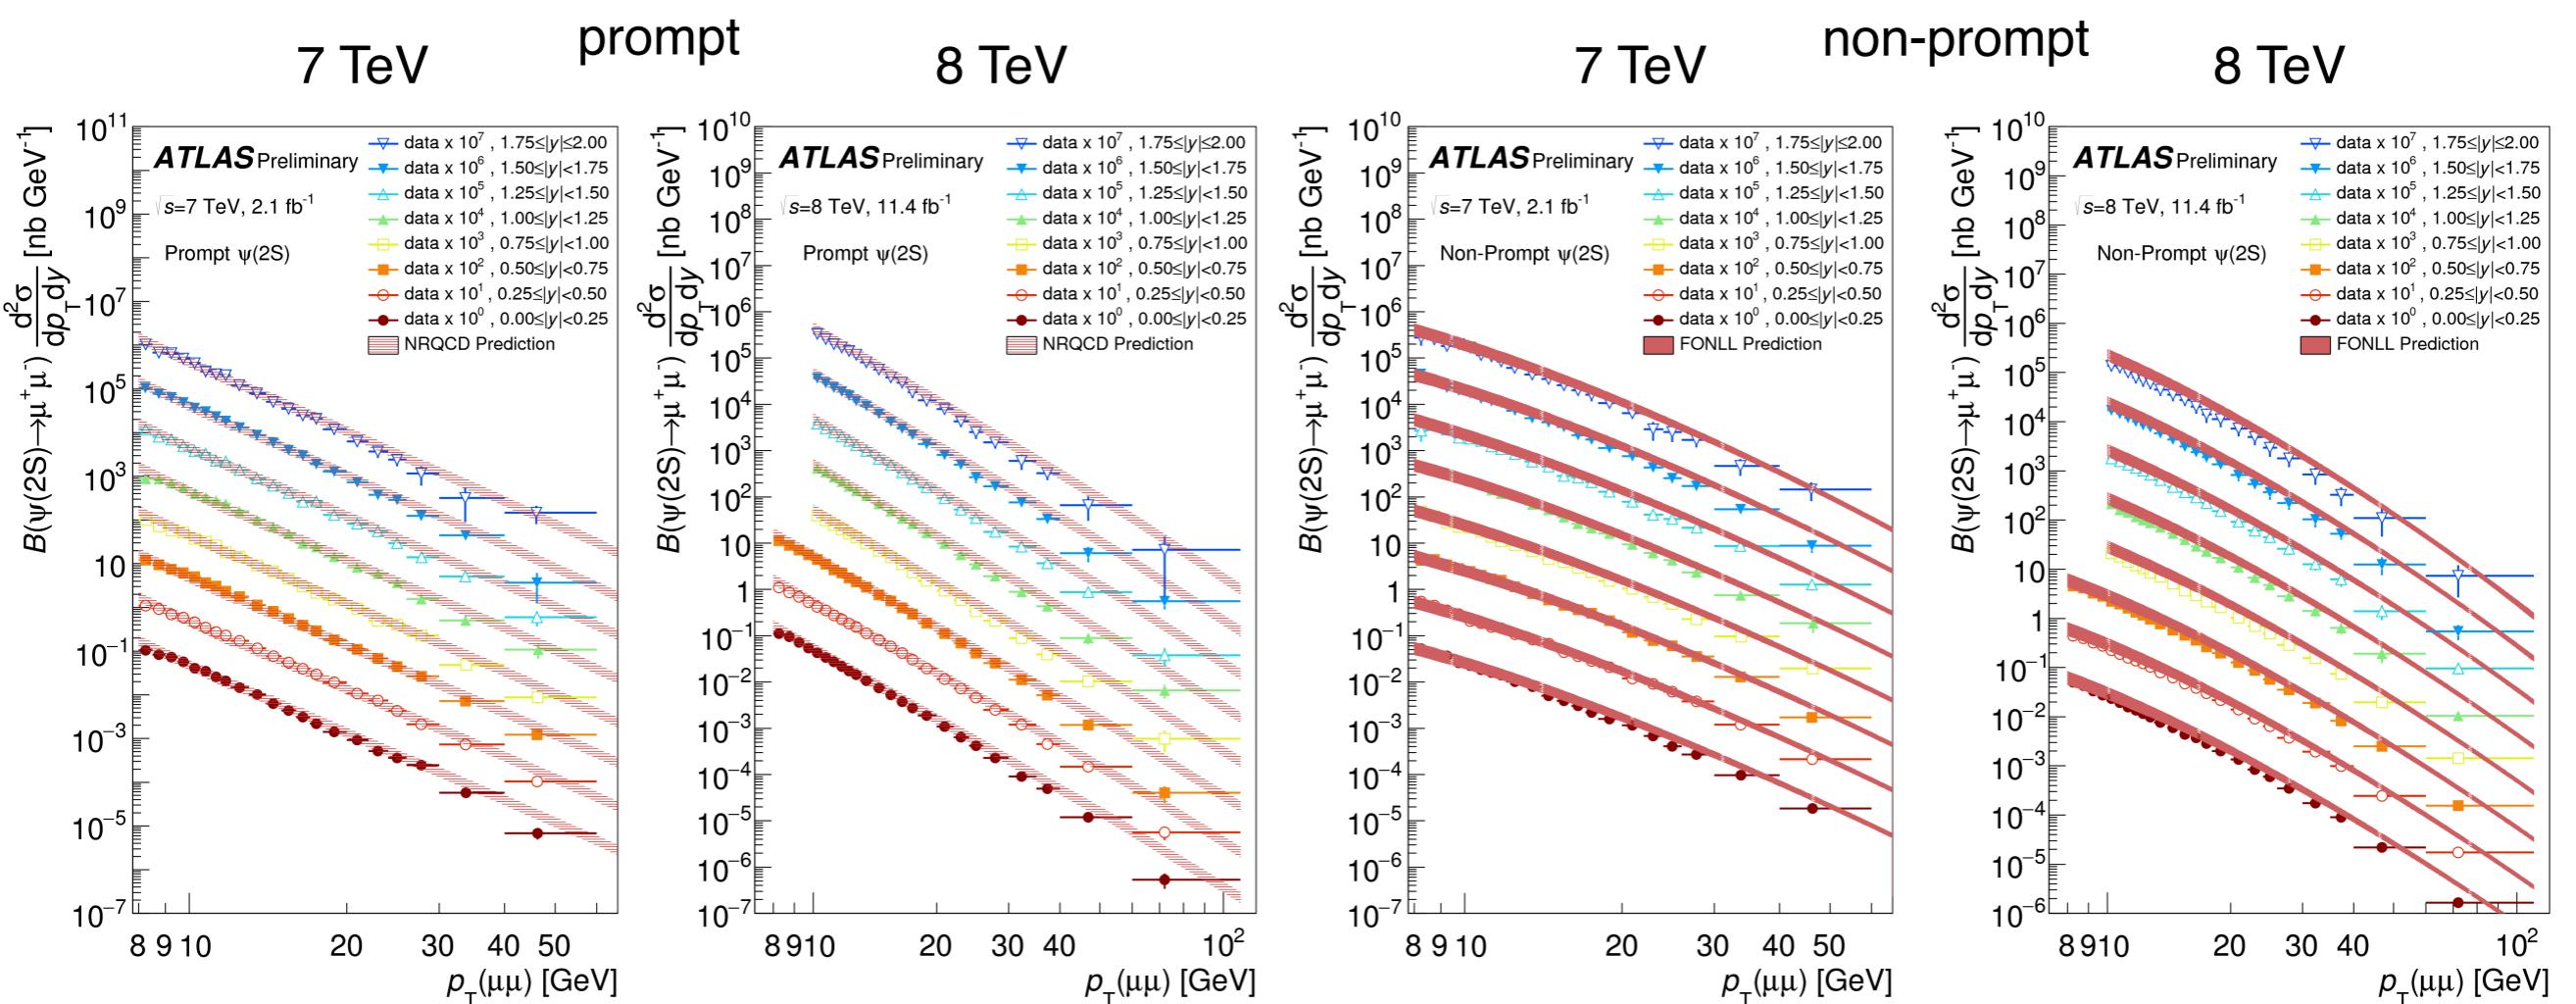

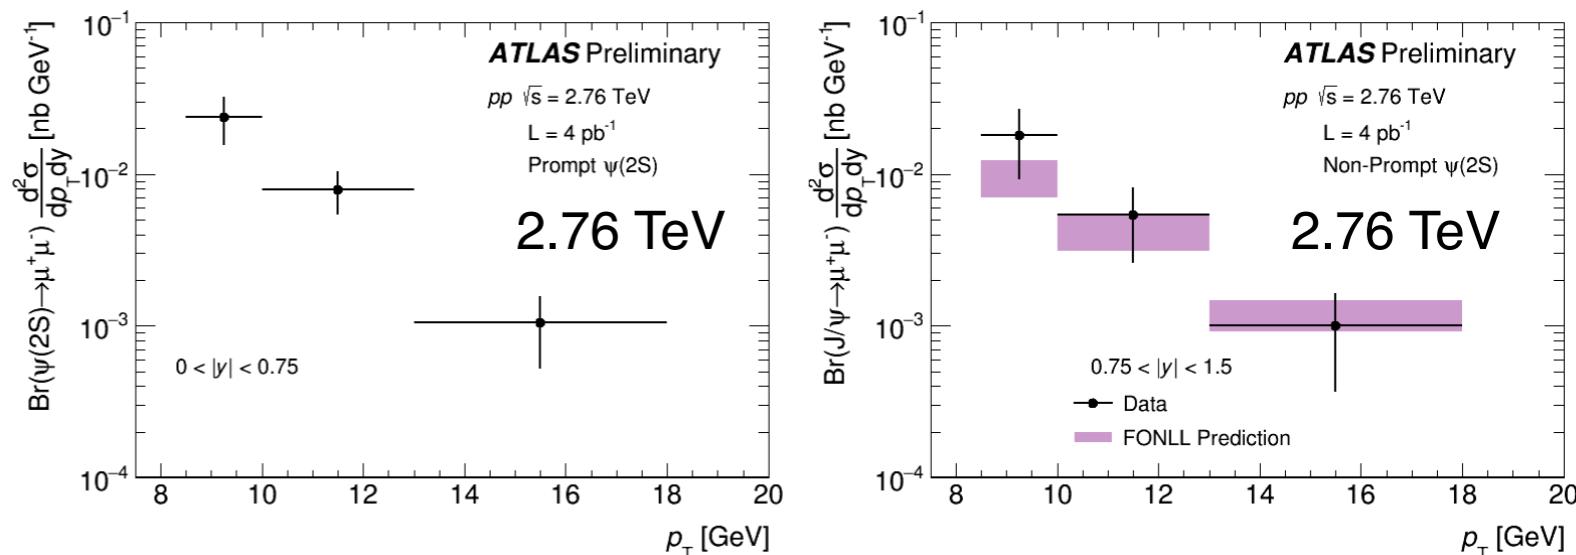

- Correcting for
 - trigger and reconstruction efficiencies
 - acceptance (depending on spin-alignment)
 - isotropic scenario considered for main result
- Double differential cross-section
 - 22 p_T bins: 8-110 GeV
 - 8 $|y|$ bins: 0-2

Quarkonium and heavy flavour production measurements at ATLAS

Prompt and non-prompt J/ψ and $\psi(2S)$ production at $\sqrt{s} = 2.76, 7$ and 8 TeV

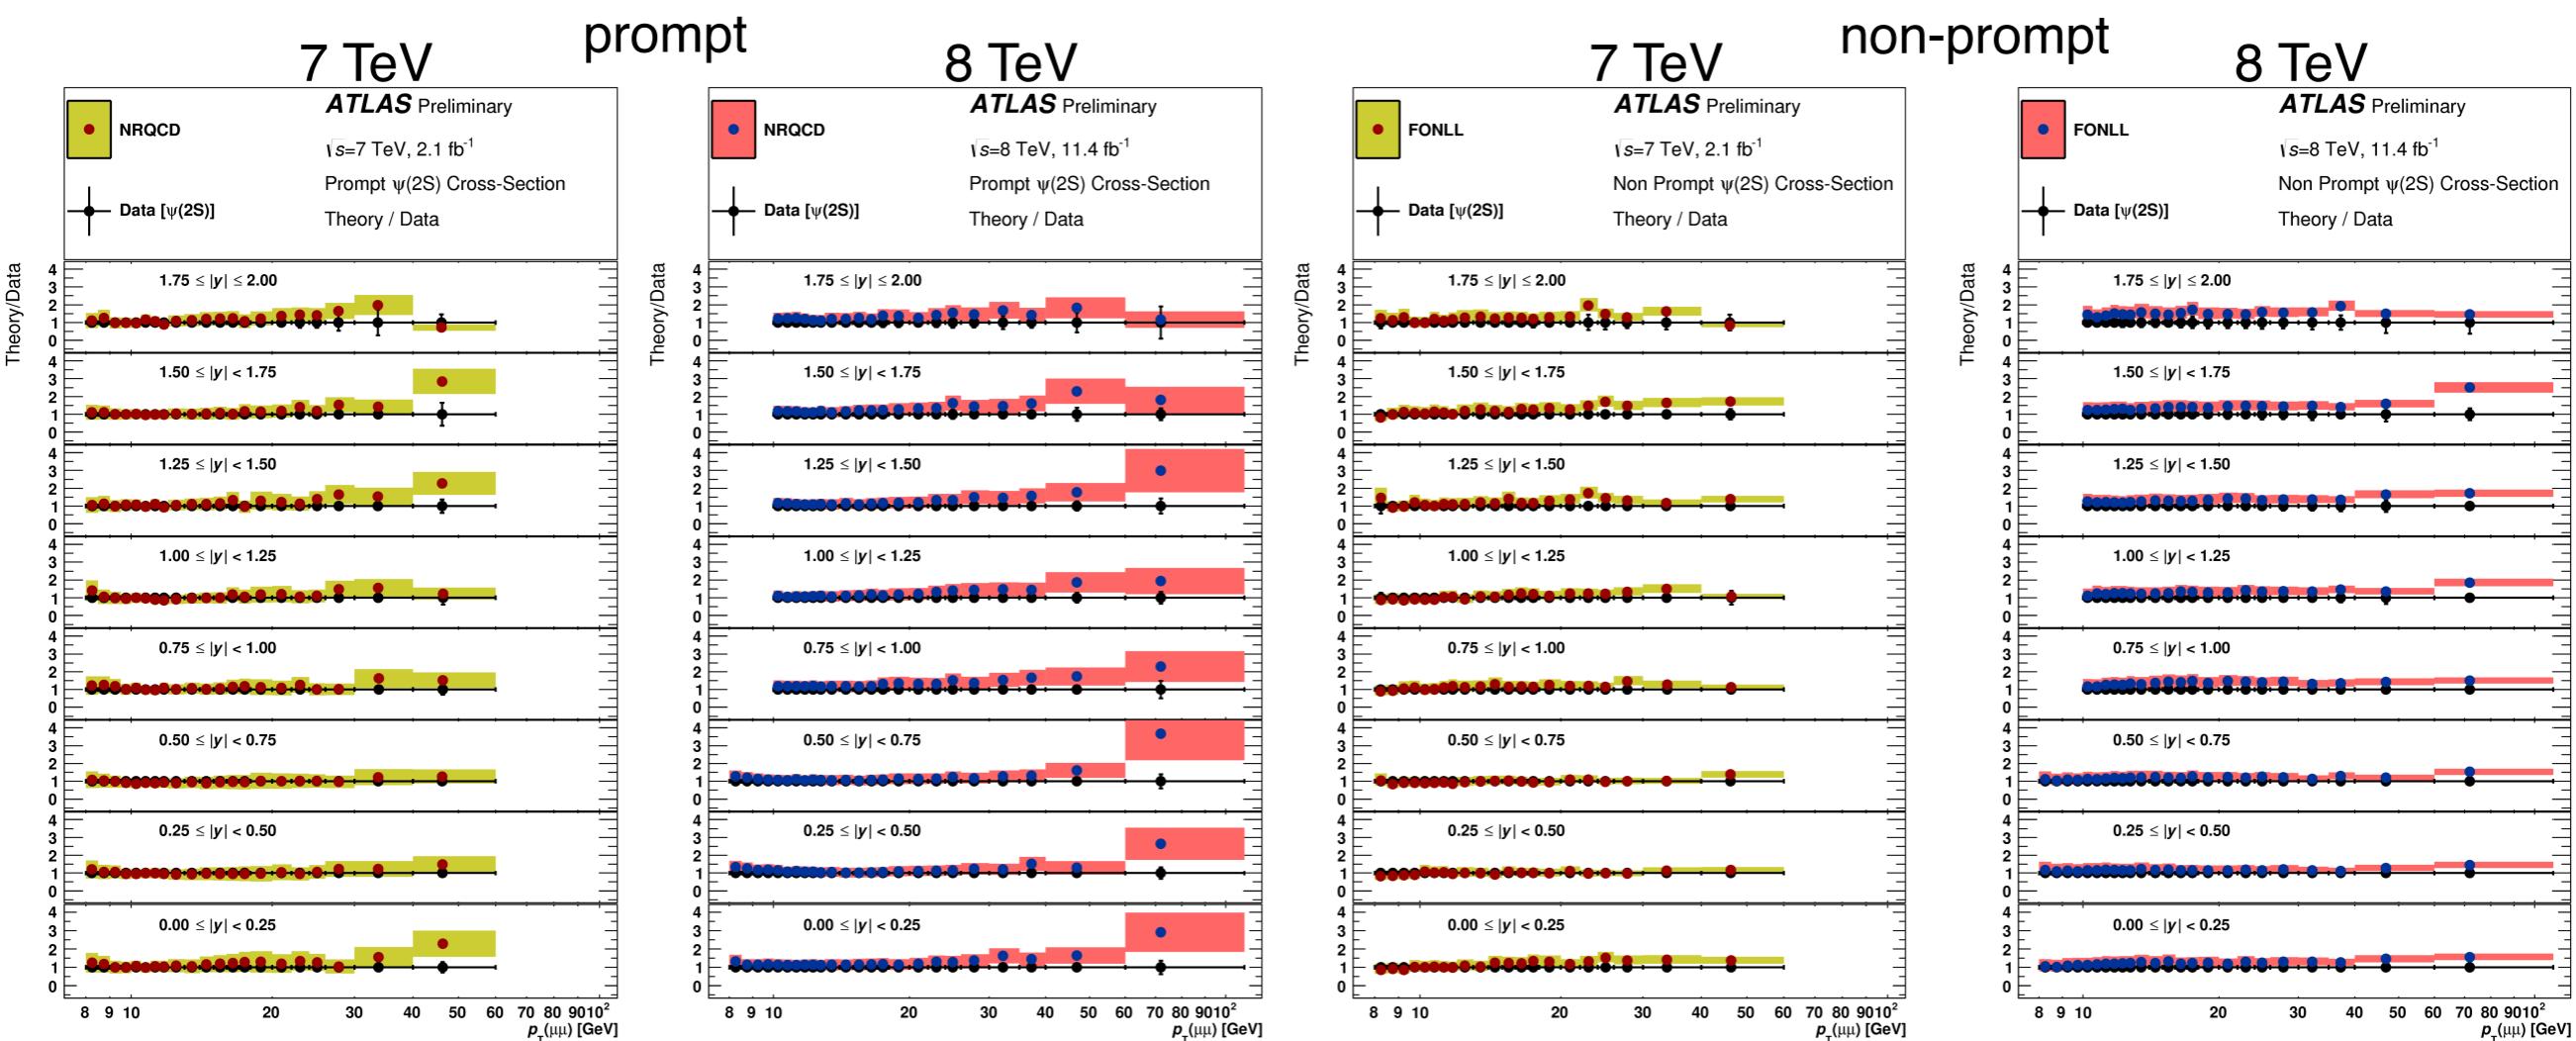

- Good agreement across range of p_T
 - harder p_T spectra predicted by theory
- No significant rapidity dependence
- Slight overestimation of non-prompt $\psi(2S)$ production compared with J/ψ predictions

Quarkonium and heavy flavour production measurements at ATLAS

Prompt and non-prompt J/ψ and $\psi(2S)$ production at $\sqrt{s} = 2.76, 7$ and 8 TeV

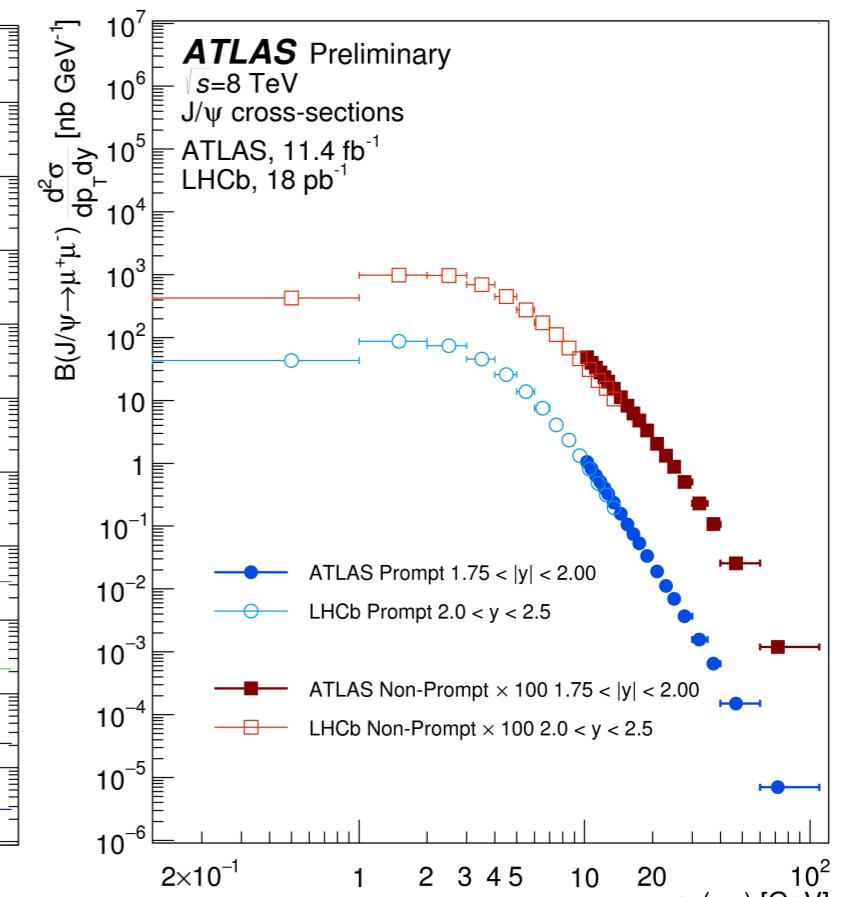

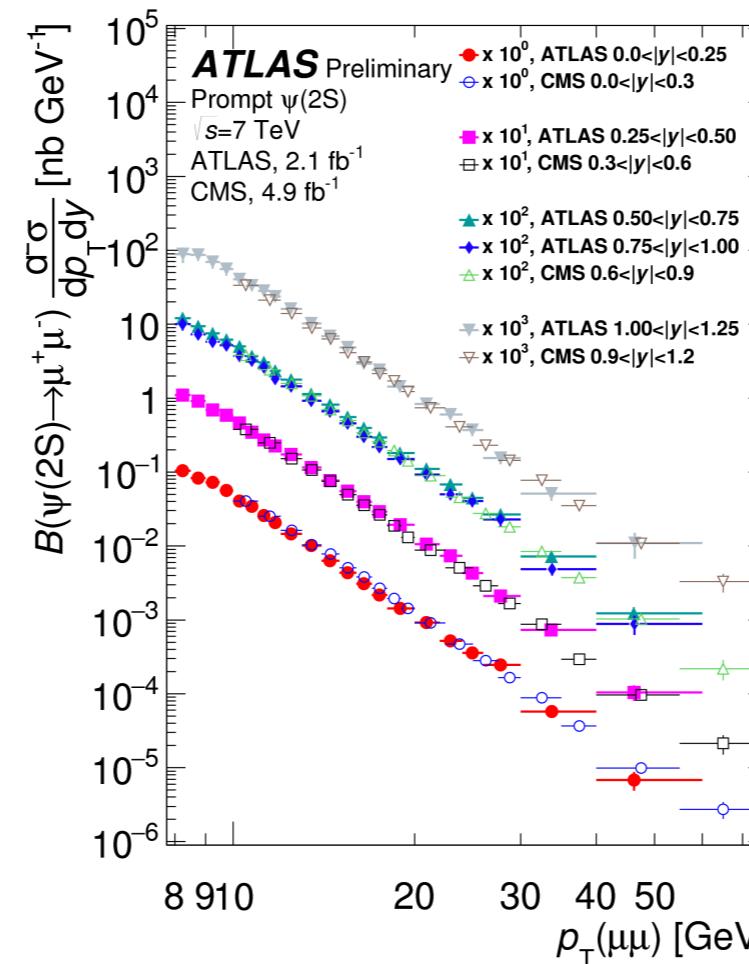

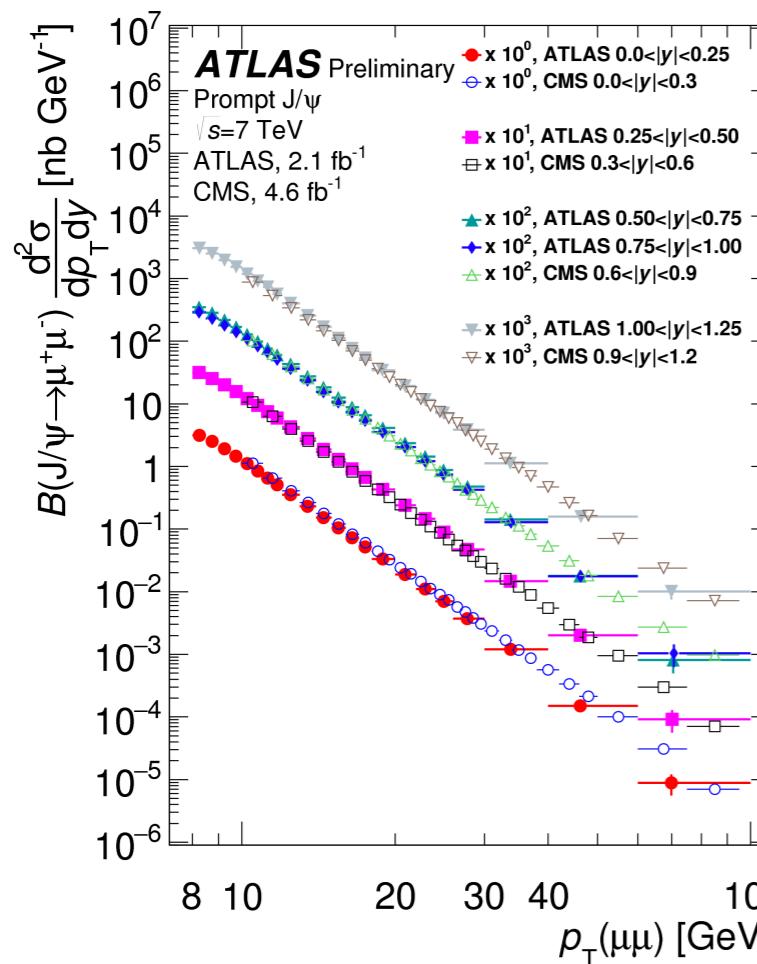

- Good agreement across range of p_T
 - harder p_T spectra predicted by theory
- No significant rapidity dependence
- Slight overestimation of non-prompt $\psi(2S)$ production compared with J/ψ predictions

Quarkonium and heavy flavour production measurements at ATLAS

Prompt and non-prompt J/ψ and $\psi(2S)$ production at $\sqrt{s} = 2.76, 7$ and 8 TeV

- Comparison with CMS¹ and LHCb² results
 - overlapping regions of p_T and $|y|$ shows good agreement
- Combination of LHC measurements provide a wide coverage on p_T and $|y|$

¹ Phys. Rev. Lett. 114.19 (2015) 191802

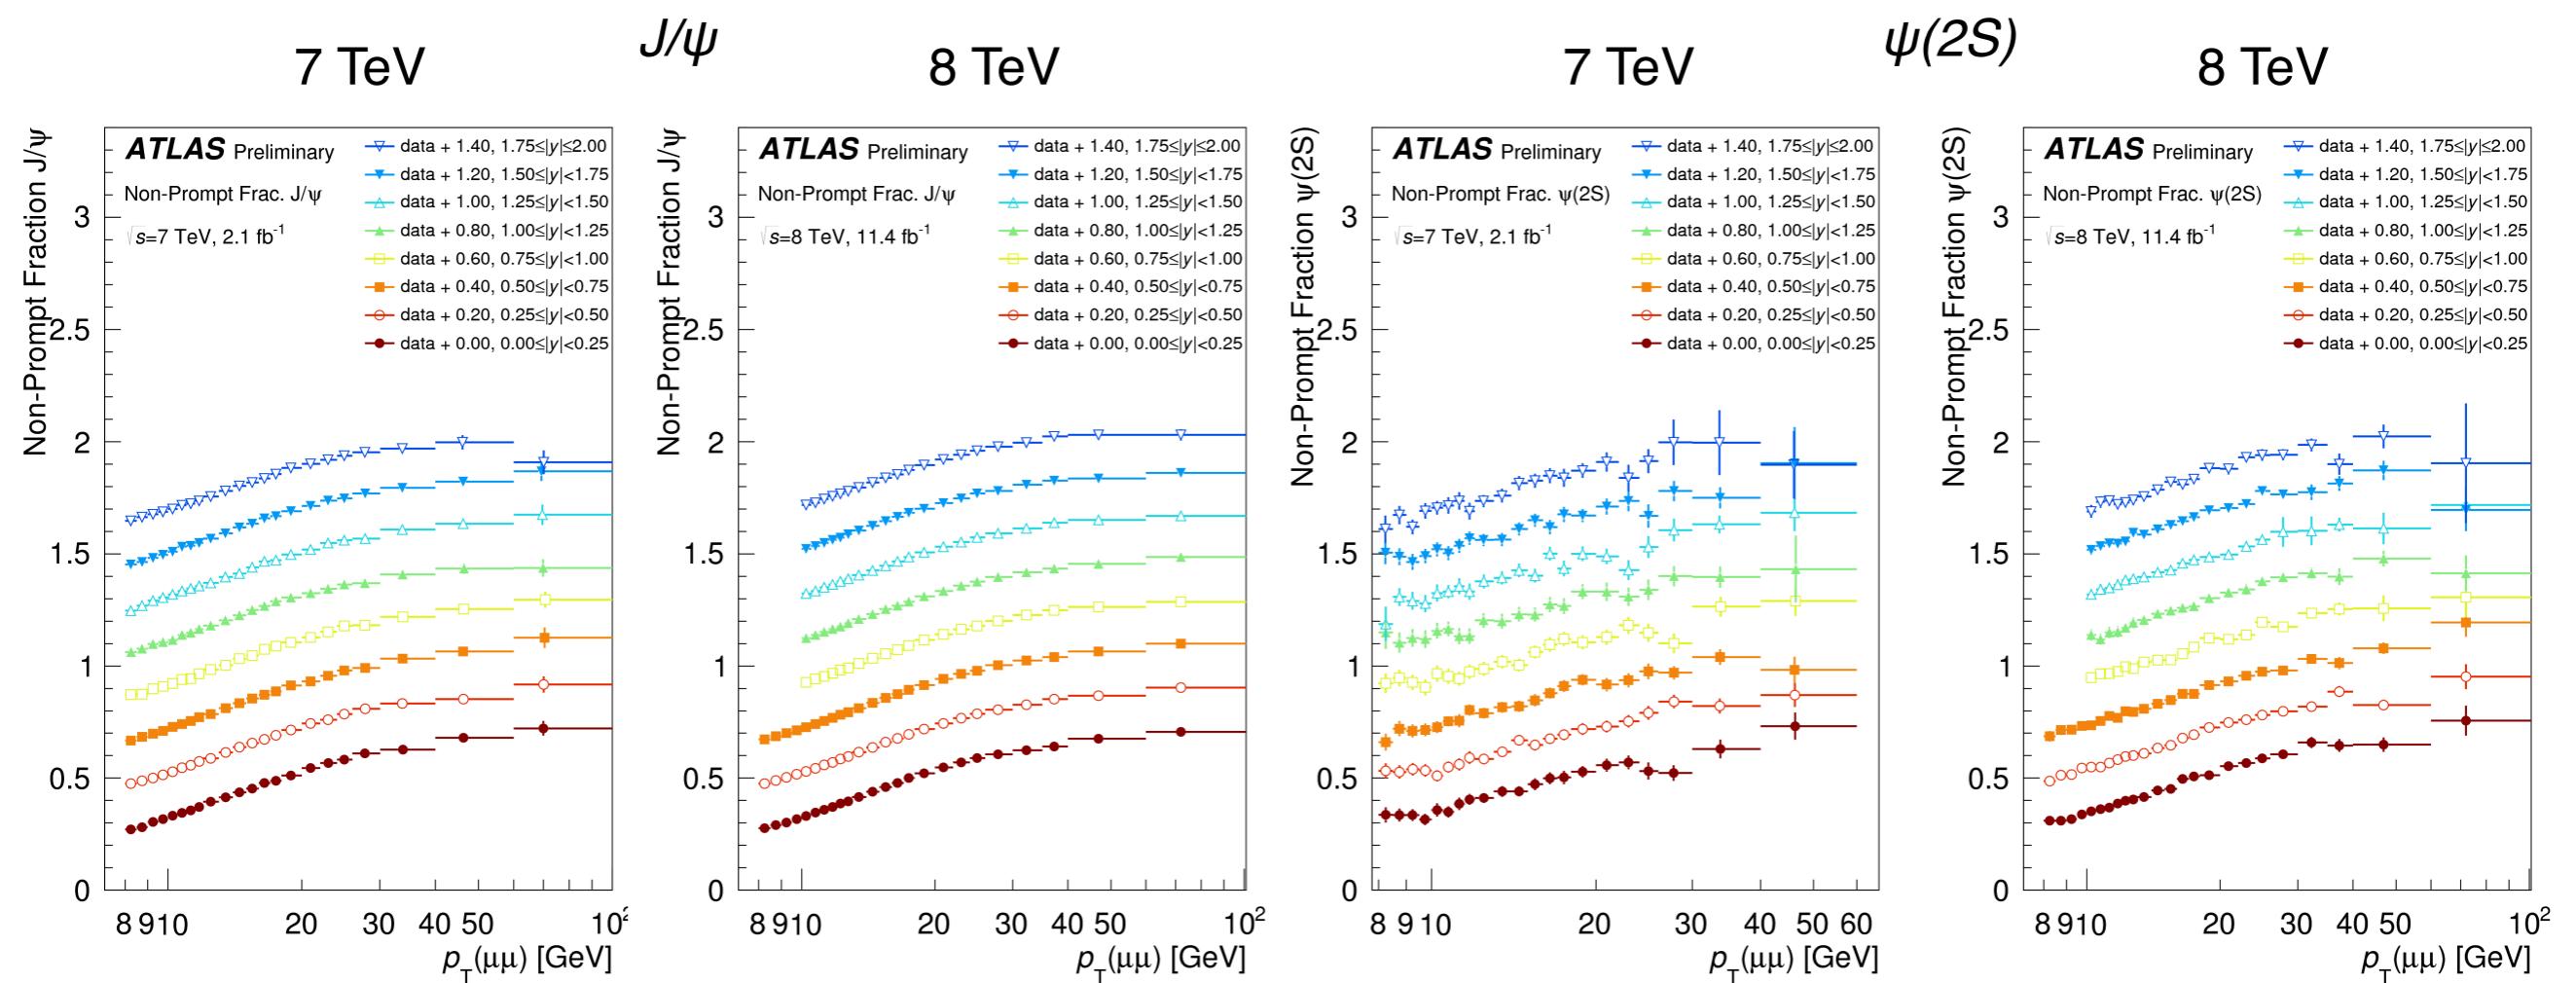

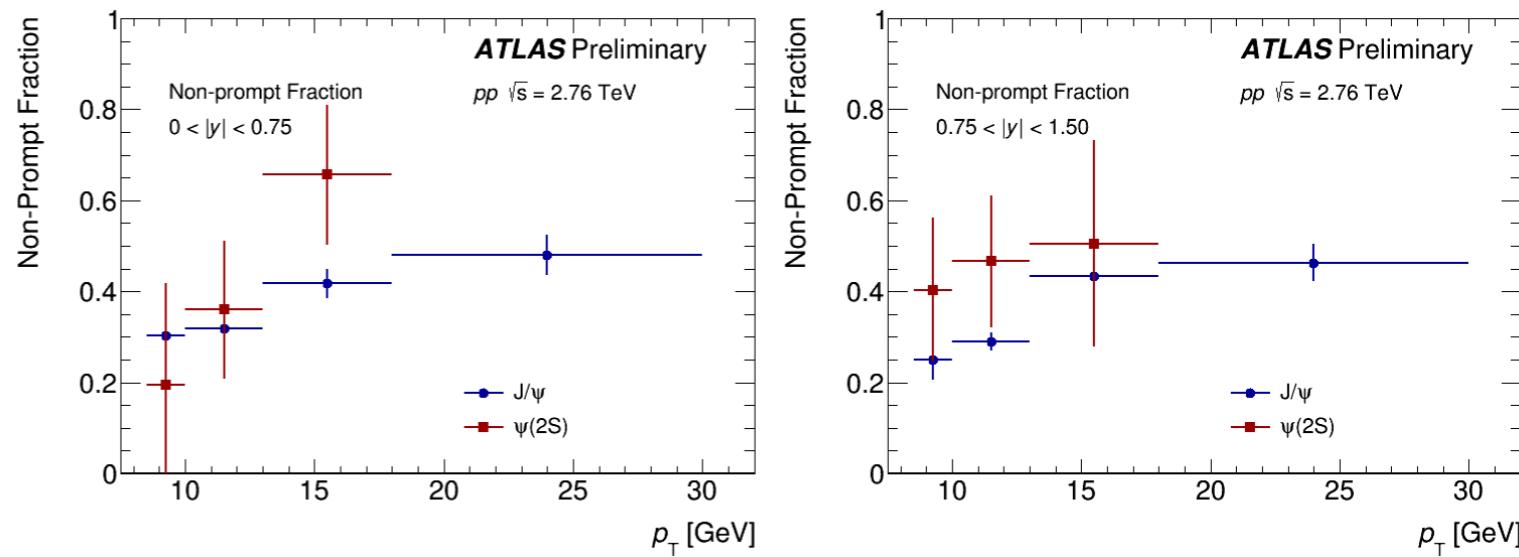

² JHEP 1306 (2013) 064

Quarkonium and heavy flavour production measurements at ATLAS

Prompt and non-prompt J/ψ and $\psi(2S)$ production at $\sqrt{s} = 2.76, 7$ and 8 TeV

- Measurement of the **non-prompt fraction**
 - J/ψ and $\psi(2S)$ at $\sqrt{s} = 7$ and 8 TeV
 - cancellation of acceptance and efficiency corrections

$$f_b^\psi \equiv \frac{pp \rightarrow b + X \rightarrow \psi + X'}{pp \xrightarrow{\text{Inclusive}} \psi + X'} = \frac{N_\psi^{\text{np}}}{N_\psi^{\text{np}} + N_\psi^{\text{p}}}$$

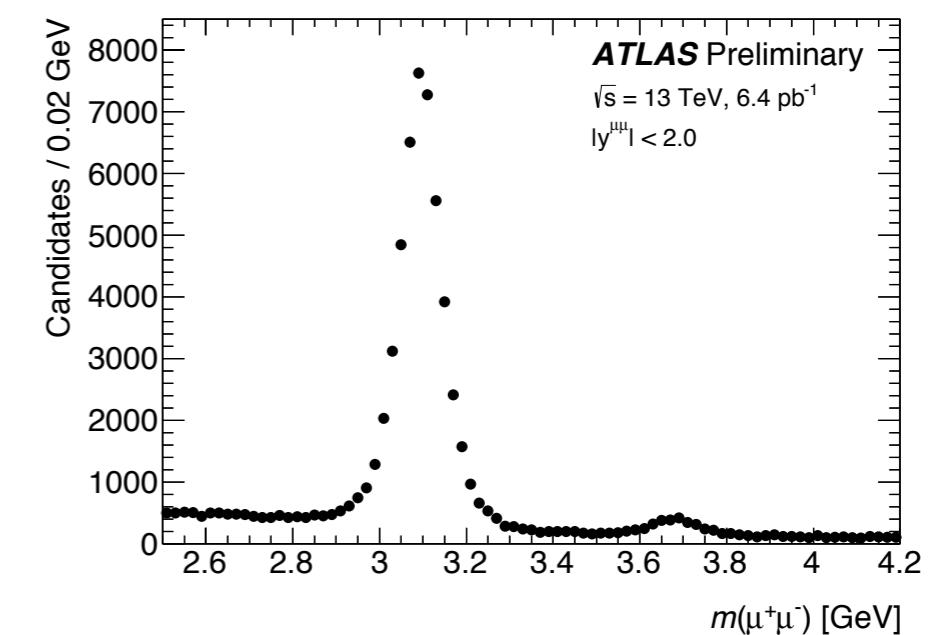

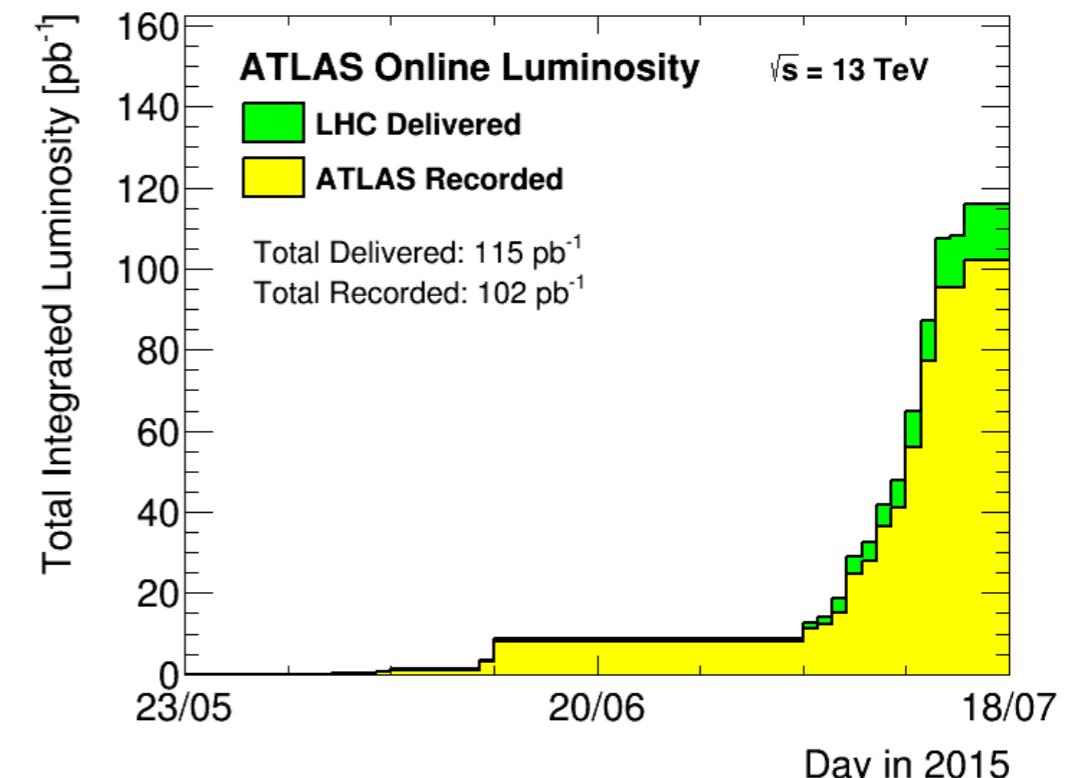

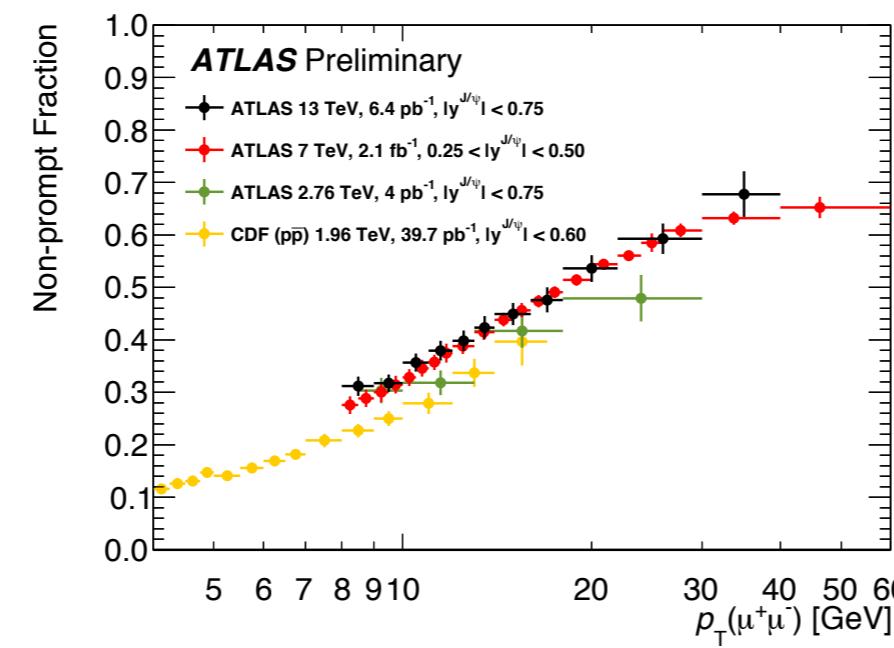

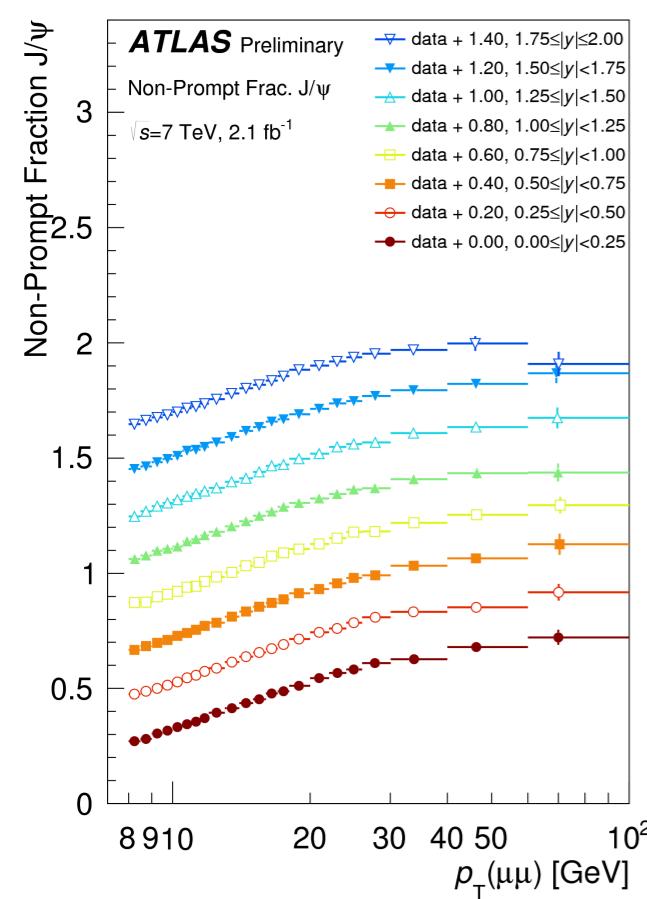

Quarkonium and heavy flavour production measurements at ATLAS

Prompt and non-prompt J/ψ and $\psi(2S)$ production at $\sqrt{s} = 2.76, 7$ and 8 TeV and **13 TeV**

- Measurement of the **non-prompt fraction**
 - J/ψ and $\psi(2S)$ at $\sqrt{s} = 7$ and 8 TeV + **13 TeV**
 - low p_T (4 GeV) di-muon or higher p_T (14 GeV) single muon trigger requirement
 - integrated luminosity of 6 pb^{-1}

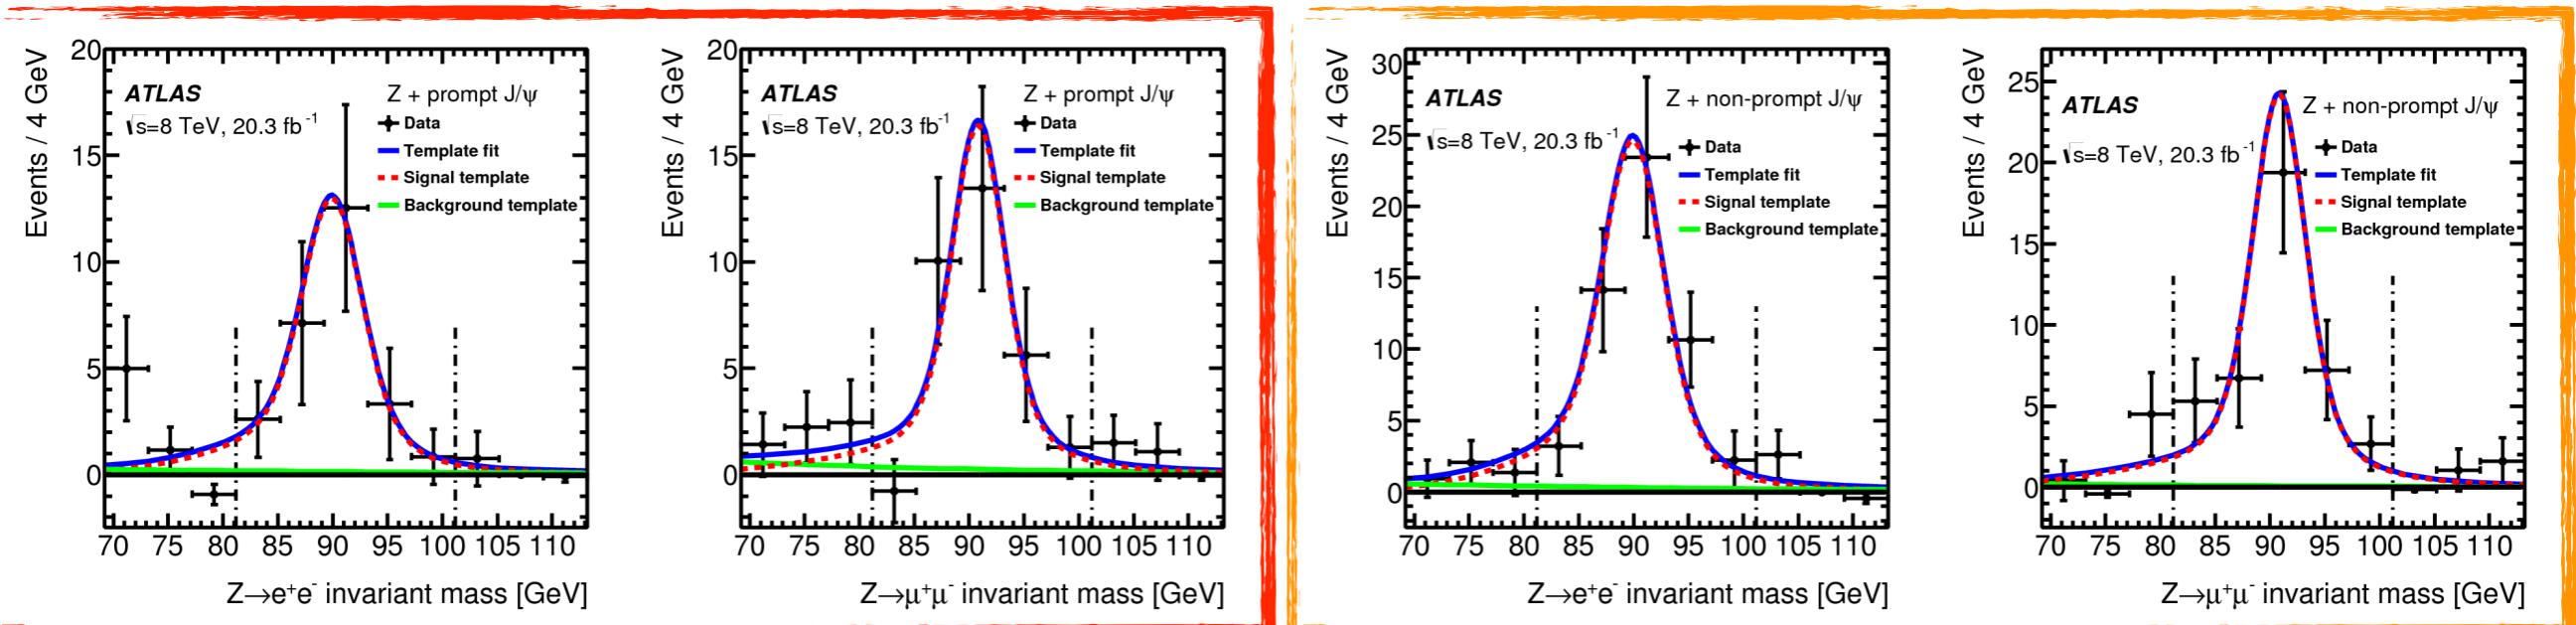

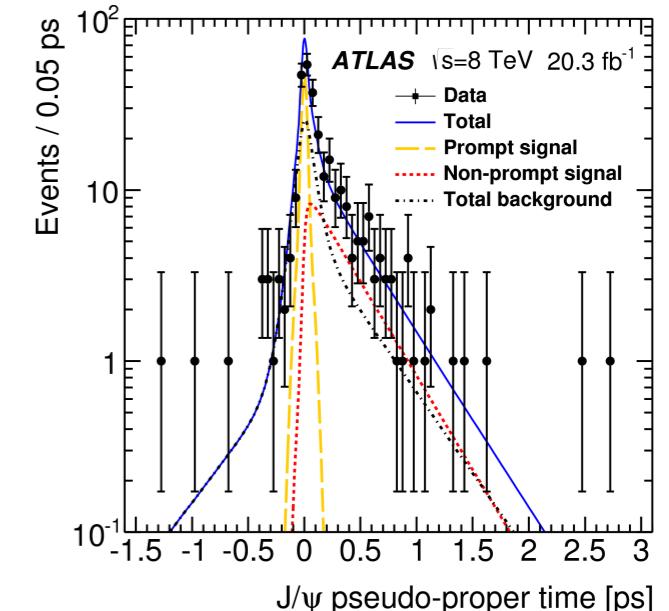

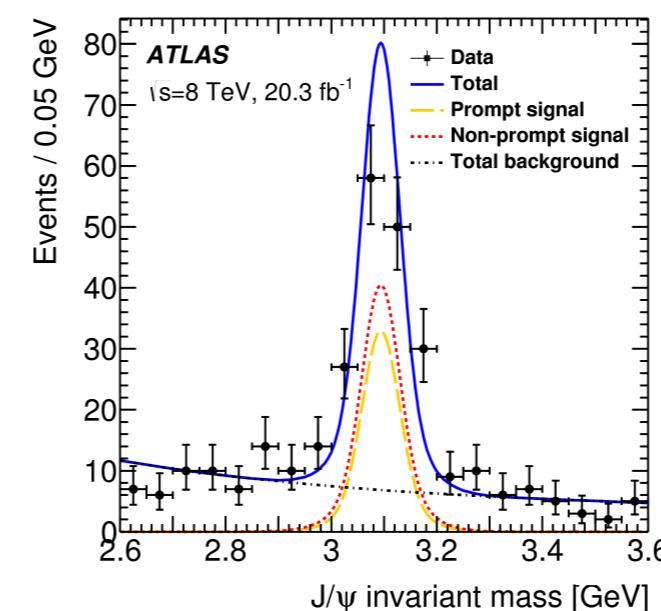

$$f_b^\psi \equiv \frac{pp \rightarrow b + X \rightarrow \psi + X'}{\underset{\text{Inclusive}}{pp \rightarrow \psi + X'}} = \frac{N_\psi^{\text{np}}}{N_\psi^{\text{np}} + N_\psi^{\text{p}}}$$

Quarkonium and heavy flavour production measurements at ATLAS

Associated production of Z bosons with prompt and non-prompt J/ψ mesons

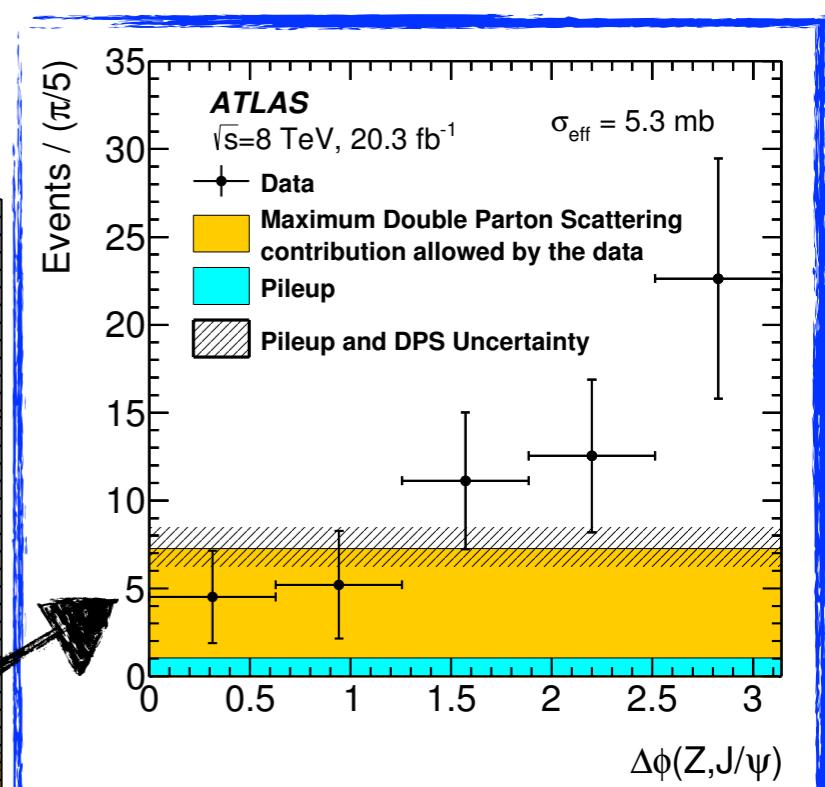

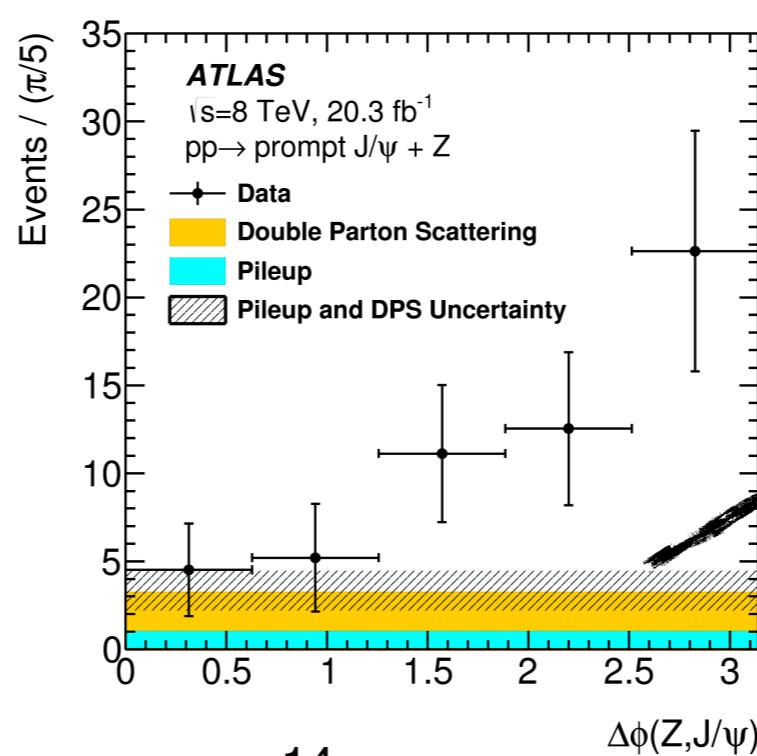

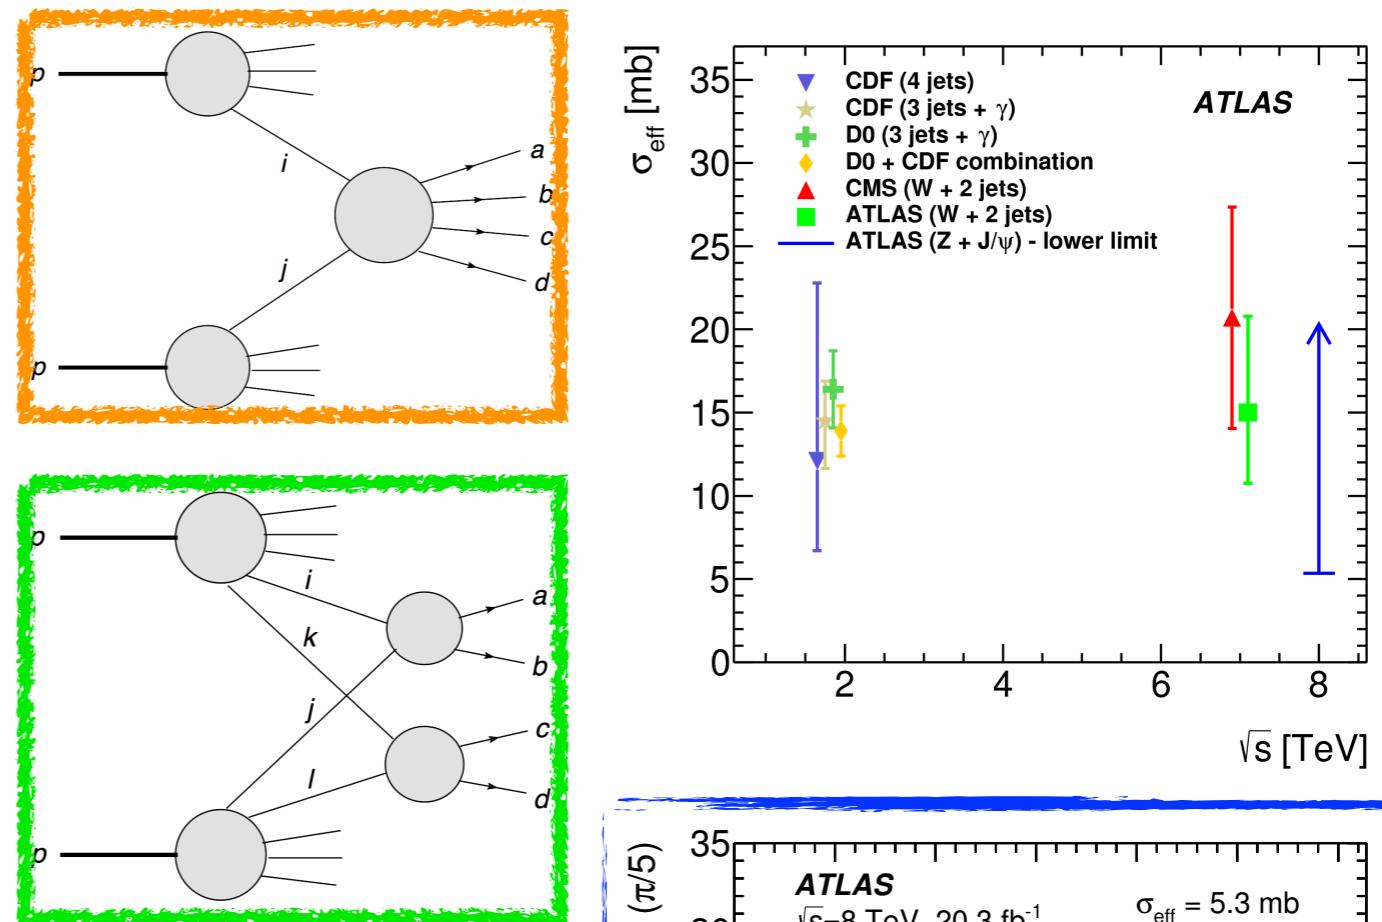

- $J/\psi + Z$ can occur
 - single parton scattering (SPS)
 - double parton scattering (DPS)
- J/ψ can be produced
 - prompt
 - non-prompt
- Additional observables and new final states provides further constraints on the contributions from colour-singlet and colour-octet production processes
- Using 20.3 fb^{-1} of $\sqrt{s} = 8 \text{ TeV}$ data
 - high- p_T single muon trigger
- Two dimensional unbinned maximum likelihood fit to separate prompt and non-prompt component

Quarkonium and heavy flavour production measurements at ATLAS

Associated production of Z bosons with prompt and non-prompt J/ψ mesons

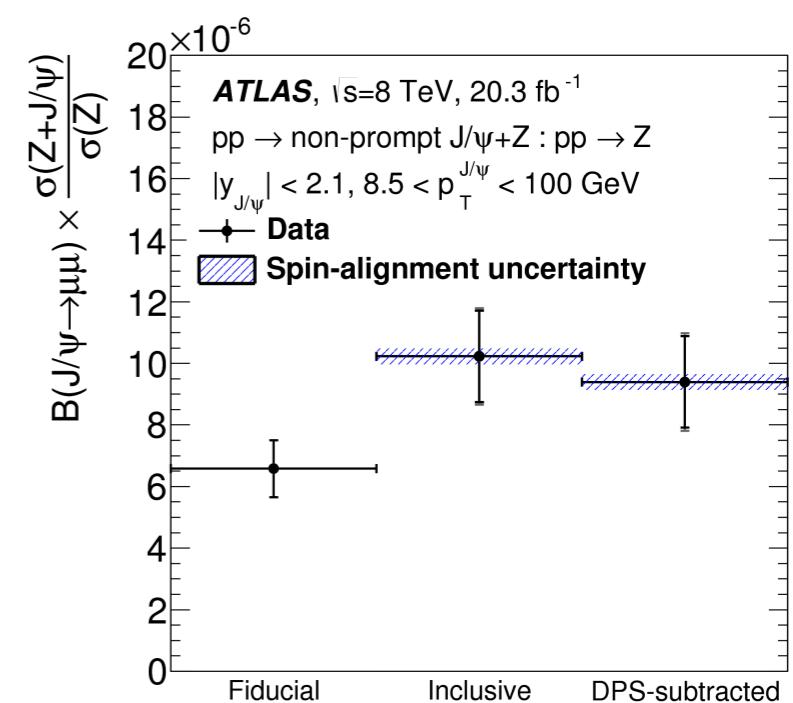

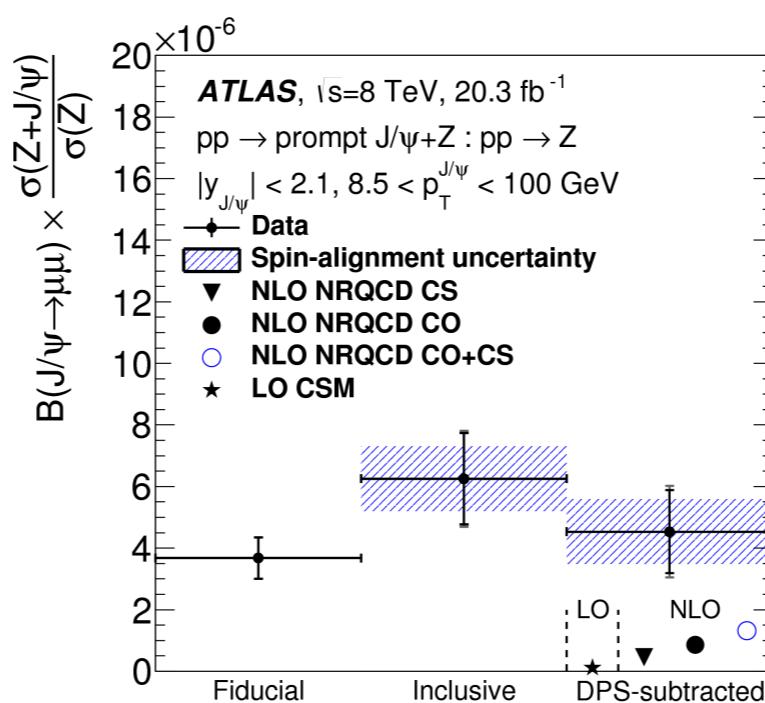

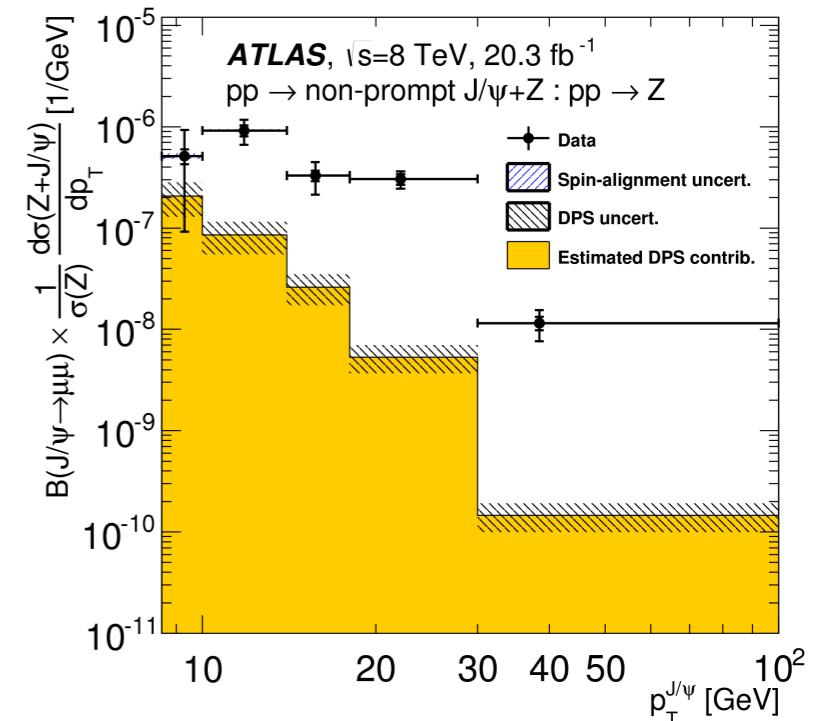

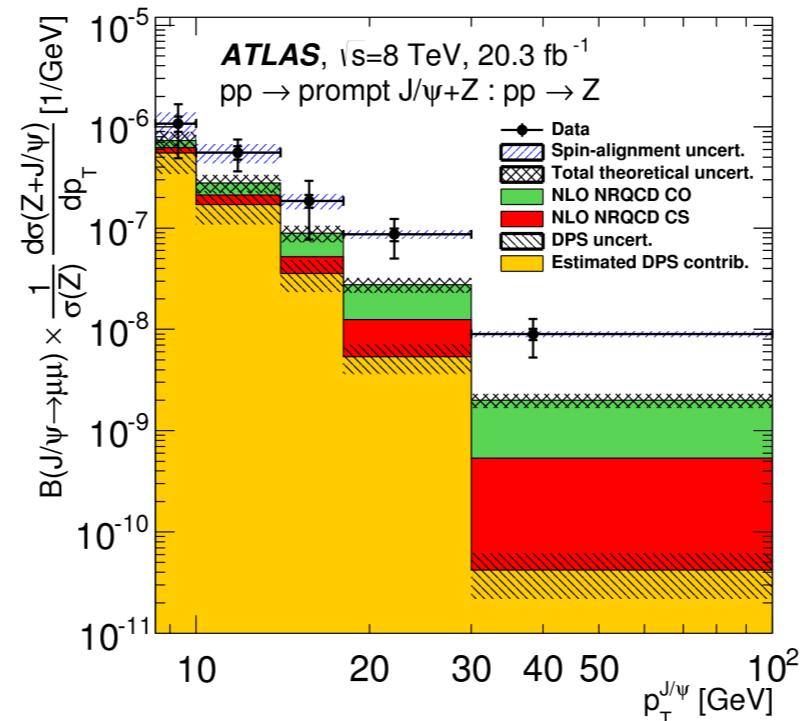

- Single parton scattering
 - both objects from the same interaction
- Double parton scattering
 - each object from independent scatter
- Indistinguishable on an event-by-event basis
- Use of discriminating variables
 - azimuthal angle between the two particles [$\Delta\phi(Z, J/\psi)$]
 - flat contribution from DPS
 - peak at $\Delta\phi=\pi$, from SPS back-to-back production
 - smeared due to detector effects
- DPS governed by a “universal” effective cross-section, σ_{eff}
- Estimation follows:
 - $N_{\text{DPS}} = P_{\text{DPS}}^{J/\psi} N_{\text{fid}} Z$
 - $P_{\text{DPS}}^{J/\psi} = \sigma_{\text{bin}}^{J/\psi} / \sigma_{\text{eff}}$
 - σ_{eff} taken from ATLAS W+2jets measurement
- Prompt: $11.1^{+5.7}_{-5.0}$
- Non prompt: $5.8^{+2.8}_{-2.6}$
- Extraction of lower limit on $\sigma_{\text{eff}} > 5.3 \text{ mb}$

Quarkonium and heavy flavour production measurements at ATLAS

Associated production of Z bosons with prompt and non-prompt J/ψ mesons

- First observation of $Z+J/\psi$
 - prompt 5σ significance
 - non-prompt 9σ significance
- One of the most rare processes
 - occurs 10 times every million Z bosons
- Total cross sections
 - theory is underestimating the SPS production
- Differential cross sections
 - low p_T dominated by DPS
 - SPS drops off less steeply with p_T than DPS
 - Theory discrepancy more pronounced with higher p_T
- DPS fraction is
 - 29% for the prompt $J/\psi + Z$
 - 8% for the non-prompt $J/\psi + Z$

Quarkonium and heavy flavour production measurements at ATLAS
