# High Performance Storage Tests At The INFN Pisa Computing Centre

*Monday 3 September 2007 08:00 (20 minutes)*

We report about the tests performed in the INFN Pisa Computing Centre with some of the latest generation storage devices. Fibre Channel and NAS solutions have been tested in a realistic enviroment, both participating in Worldwide CMS's Service Challenges, and simulating analysis patterns with more than 500 jobs accessing concurrently]data files. Both usage pattern have evidentiated the ability to use today's storage links at 10 Gbit/s, allowing a steady transfer rate exceeding what a single Gbit/s interface cannot guarantee when the number of concurrent users increase over a few hundred nodes.

## Summary

We report about the tests performed in the INFN Pisa Computing Centre with some of the latest generation storage devices. Fibre Channel and NAS solutions have been tested in a realistic enviroment, both participating in Worldwide CMS's Service Challenges, and simulating analysis patterns with more than 500 jobs accessing concurrently]data files. Both usage pattern have evidentiated the ability to use today's storage links at 10 Gbit/s, allowing a steady transfer rate exceeding what a single Gbit/s interface cannot guarantee when the number of concurrent users increase over a few hundred nodes.

**Primary author:** Dr MAZZONI, Enrico (INFN Pisa)

**Co-authors:** Dr CIAMPA, Alberto (INFN Pisa); Dr DAVINI, Maurizio (Universita' di Pisa); Dr AREZZINI, Silvia (INFN Pisa); Dr SARKAR, Subir (INFN Pisa)

**Presenter:** Dr MAZZONI, Enrico (INFN Pisa)

**Session Classification:** Poster 1

**Track Classification:** Computer facilities, production grids and networking
