

DAQ status after the mock data run

Summary

- First attempt to run with all the crates being sync by the new trigger system - 90 % successful. A minor issue in the case when running with only one crate in the Hall (EMR or Tracker). To be investigated.
- A very good work with Ed Overton on the implementation of the Tracker veto in the logic of the Particle triggers.
- Persistent problems (not critical) with the new versions of the DATE code. Two different versions have been tested. Both found to have bugs. I guess this is because LHC is OFF and ALICE takes only mock data runs ;)
