Universa	I Extra Dimension					
min	imal Universal Extr	a Dimensioi	n			
	In minimal UED \Rightarrow mUED, 5D space-time is $M^4 imes S_1/Z_2$					
	• There are KK-excita	tions of every	SM particles			
KK-	parity conserved	\implies	• Can only be pair prod	uced		

• Gives Dark Matter

 $\Rightarrow Spectra depends on the cut-off scale \Lambda and <math>R^{-1}$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

- Λ can not be too large, otherwise gauge couplings blow off.
- Spectra of KK-particles is pretty degenerate at each level

With only level-1 KK excitations, similar to compressed SUSY

Model: nmUED

Universal Extra Dimension

Extra Dimension vs SUSY at the LHC

However, most SUSY breaking scenarios do not give such a compressed spectra

- Pair production of SUSY particles and their decay gives high p_T jets plus missing transverse energy.
 - Classic signals of SUSY
 - Will distinguish SUSY from UED

However, LHC Higgs data do not agree with mUED at the 1σ level

Need to go beyond mUED \implies non-minimal UED \implies nmUED

Introduction	Model: nmUED	Phenomenology	Conclusion

Model: nmUED

 $S = S_{bulk} + S_{BLKT}$

$$\begin{split} \mathcal{S}_{bulk} &= \int \mathrm{d}^4 x \int_{-L}^{L} \mathrm{d} y \Big[\sum_{\mathcal{A}}^{G,W,B} - \frac{1}{4} \mathcal{A}_{MN} \mathcal{A}^{MN} + \sum_{\Psi}^{Q,U,D,L,E} i \bar{\Psi} \overleftarrow{D}_{M} \Gamma^{M} \Psi - M_{\Psi} \bar{\Psi} \Psi \Big] \\ \mathcal{S}_{bdry} &= \int \mathrm{d}^4 x \int_{-L}^{L} \mathrm{d} y \Big(\sum_{\mathcal{A}}^{G,W,B} - \frac{r_{\mathcal{A}}}{4} \mathcal{A}_{\mu\nu} \mathcal{A}^{\mu\nu} + \sum_{\Psi=Q,L} i r_{\Psi} \bar{\Psi}_L D_{\mu} \gamma^{\mu} \Psi_L \\ &+ \sum_{\Psi=U,D,E} i r_{\Psi} \bar{\Psi}_R D_{\mu} \gamma^{\mu} \Psi_R \Big) \times [\delta(y-L) + \delta(y+L)]. \end{split}$$

Parameters:

Coefficients of the BLKT terms

• $r_A \implies r_g, r_W, r_B$

• $r_{\psi} \implies r_U, r_D, r_E$

• Also involve $M_{\psi} = \mu \theta(y) \Longrightarrow 5D$ fermion bulk mass.

Masses of the KK-gauge bosons and fermions are determined by solving transcendental equations

Introduction	Model: nmUED	Phenomenology	Conclusion
	•		
Constraints on the parameters			
Constraints on t	the parameters		

- $\frac{r_{\Psi}}{L} > \frac{\exp^{-2\mu L} 1}{2\mu L}$ to avoid ghosts and/or tachyons in the fermion sector.
- *r*_A/*L* > −1 to avoid ghosts and/or tachyons in the gauge sector.
- The bounds on the parameters are also obtained from the low-energy observables. [T. Flacke, K. Kong and S. C. Park, JHEP 1305, 111 (2013)]
 - KK-parity conserving interactions, \mathcal{L}_{002n}
 - $Z^{(2)}$ contribute to 4-fermi interactions
 - $r_A > 0.5L$ for $\mu L = -0.1$ and fixed R^{-1}
 - However, for $0 > \mu L > -0.03$ and $R^{-1} \approx 850$ GeV, g_{200} will be small and $M_{Z^{2n}}$ will be heavy enough to escape this bound
- EW precision test and the collider searches are insensitive to small values of μ , for example $\mu L = -0.02$

We discuss the implications of nmUED in the context of the Higgs data and multijets plus E_T searches at the 8 TeV LHC

- Parameters of the model:
 - r_{ψ} , $\Psi = Q$, U, D, L, E
 - r_A , A = G, W, B
 - $\mu \Longrightarrow$ Bulk fermion mass term
- Take universal boundary parameters for all quarks and leptons $\implies r_F$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- For gauge sector, we choose $r_g \neq r_W = r_B$
- Also choose $\mu L = -0.02$

Phenomenology

Mass spectra for level-1 KK-excitations

Figure : Level-1 gauge boson (left panel) and fermion (right panel) as a function of r/L for three different values of R^{-1} . For the level-1 fermion masses in the right panel, we consider $\mu = -0.02L$.

- Both level-1 KK-fermions and gauge bosons masses increase if we decrease r/L.

- $m_H = 125 \text{ GeV} \implies \lambda = 0.129 \text{ in the SM}$
- $\lambda \rightarrow 0$ at $Q = 10^{11} \text{ GeV} \Longrightarrow$ Vacuum instability
- For mUED, λ evolves much faster because of KK-excitations
 - $\lambda
 ightarrow$ 0 at 4-6 R^{-1}
 - For subsequent analysis, we take $\Lambda = 5R^{-1}$
- Higgs production measured in different channels at the LHC

$$\mu_i = \frac{(\sigma \times \text{BR})_i}{(\sigma \times \text{BR})_i^{\text{SM}}}$$

Combined best-fit values for μ_i

[G. Belanger, B. Dumont, U. Ellwanger, J. F. Gunion and S. Kraml, PRD 88, 075008 (2013)]

$\gamma\gamma$ decay	/ channel	VV deca	y channel		
$\hat{\mu}^{ggF}$	$\hat{\mu}^{ ext{VBF}}$	$\hat{\mu}^{ggF}$ $\hat{\mu}^{VBF}$			
0.98±0.28	$1.72{\pm}0.59$	0.91±0.16	$1.01{\pm}0.49$		

Table : Combined best-fit Higgs signal strengths for different Higgs production and decay modes. Results for mUED: has only 2 parameters $\implies \Lambda$ and R^{-1}

Figure : Higgs signal strengths relative to the SM expectations: $\mu_{ggF}^{H \to \gamma\gamma}$ (left panel), $\mu_{VBF}^{H \to \gamma\gamma}$ (middle panel) and $\mu_{ggF}^{H \to VV}$ (right panel), in the context of mUED scenario as a function of R^{-1} . The combined best-fit values (from Table 1) of the abovementioned Higgs signal strengths are also presented. Can not fit data at 1σ level (see middle panel)

Introduction	Model: nmUED	Phenomenology	Conclusion
		0000000	
Higgs Phenomenology			
Results for nmU	ED		

In addition to R^{-1} and Λ , we have several additional parameters coming from the BLK terms

- r_{ψ} , $\Psi = Q$, U, D, L, E
- r_A , A = G, W, B
- $\mu \Longrightarrow$ Bulk fermion mass term
- We choose cut-off scale $\Lambda = 5R^{-1}$
- Universal r_F
- But, for gauge sector, we choose $r_g \neq r_W = r_B$
- Also choose $\mu L = -0.02$

We have scanned the parameter space (r_W, r_F) to fit the Higgs data in different channels for 2 values of R^{-1} (1.2 and 1.3 TeV)

Introduction	Model: nmUED	Phenomenology	Conclusion
		00000000	
Higgs Phenomenology			
Continued			

Figure : Scattered points in $r_W/L-r_F/L$ plane which are consistent with the combined best-fit results of $\mu_{ggF}^{H\to\gamma\gamma}$, $\mu_{VBF}^{H\to\gamma\gamma}$, $\mu_{ggF}^{H\to\gamma\gamma}$, $\mu_{ggF}^{H\to\gammaV}$ and all three together for $R^{-1} = 1.2$ TeV (left panel) and $R^{-1} = 1.3$ TeV (right panel).

All combined best-fit Higgs data is consistent with nmUED for large r_W and negative r_F

Model: nmUED

Phenomenology

Collider Phenomenology at the LHC

Collider Phenomenology at the LHC

- Use the LHC data for SUSY search and if we can reproduce the exact limits for nmUED using the allowed parameter space
- We use 8 TeV LHC data with $L=20.3~{
 m fb}^{-1}$
- Two questions:
 - Can we reproduce any SUSY signals from the level-1 KK particles using the allowed parameter space of nmUED ?
 - What limits we can put on $q^{(1)}$ and $g^{(1)}$ masses in nmUED ?

Model: nmUED

Phenomenology

Conclusion

Collider Phenomenology at the LHC

Introduction	Model: nmUED	Phenomenology	Conclusion
00	o	00000000	
Conclusion			

- Though mUED signals are very different from the SUSY signals at the LHC, nmUED signals are not.
- With switable choice of BLK terms, we can reproduce any multijets + ∉_T signal given by SUSY in nmUED.
- If enhancement in $H \rightarrow \gamma \gamma$ persists in LHC Run 2, it is allowed in nmUED, but not in mUED.
- nmUED with the assumption $m_{q^1} = m_{g^1}$, 8 TeV LHC limit is ~ 2.1 TeV.
- Since nmUED can reproduce any SUSY signals, the production of level-2 KK excitations will be the key to distinguish between extra-dimension and supersymmetry if any signal is seen.
