## A search for dark matter annihilation in the newly discovered dwarf galaxy Reticulum 2

*Tuesday, August 4, 2015 4:00 PM (15 minutes)*

I will present results from a search for gamma-ray emission in nine Milky Way satellites recently discovered in the Dark Energy Survey. The nearest of these, Reticulum 2, shows evidence for a signal in public Fermi data. The detected emission is consistent with annihilating dark matter with a particle mass less than a few hundred GeV. Different ways of treating the background yield different significances – ranging from 2.3 sigma to greater than 3.7 sigma (after trials) – and I will discuss the caveats involved. I will discuss tests that any dark matter interpretation must pass.

### Oral or Poster Presentation

Oral

**Author:** GERINGER-SAMETH, Alex (Carnegie Mellon University)

**Presenter:** GERINGER-SAMETH, Alex (Carnegie Mellon University)

**Session Classification:** AstroParticle, Cosmology, Dark Matter Searches, and CMB

**Track Classification:** Cosmology and Dark Matter Experiment
