1. Introduction

Deep-Inelastic Scattering (DIS):

Hadronic tensor for heavy quark production via single photon exchange:

$$W_{\mu\nu}^{Q\bar{Q}}(q, P, s) = \frac{1}{4\pi} \int d^4\xi \exp(iq\xi) \langle P, s | [J_\mu^{em}(\xi), J_\nu^{em}(0)] | P, s \rangle_{Q\bar{Q}}$$

$$\text{unpol.} \left\{ \begin{aligned} &= \frac{1}{2x} \left(g_{\mu\nu} - \frac{q_\mu q_\nu}{q^2} \right) F_L^{Q\bar{Q}}(x, Q^2) + \frac{2x}{Q^2} \left(P_\mu P_\nu + \frac{q_\mu P_\nu + q_\nu P_\mu}{2x} - \frac{Q^2}{4x^2} g_{\mu\nu} \right) F_2^{Q\bar{Q}}(x, Q^2) \end{aligned} \right.$$

$$\text{pol.} \left\{ \begin{aligned} &-\frac{M}{2Pq} \varepsilon_{\mu\nu\alpha\beta} q^\alpha \left[s^\beta g_1^{Q\bar{Q}}(x, Q^2) + \left(s^\beta - \frac{sq}{Pq} p^\beta \right) g_2^{Q\bar{Q}}(x, Q^2) \right]. \end{aligned} \right.$$

- Light quarks: In Bjorken limit, $\{Q^2, \nu\} \rightarrow \infty$, x fixed, at twist $\tau = 2$ -level:

$$\underbrace{F_i(x, Q^2)}_{\text{structure functions}} = \sum_j \underbrace{C_i^j\left(x, \frac{Q^2}{\mu^2}\right)}_{\text{Wilson coefficients, perturbative}} \otimes \underbrace{f_j(x, \mu^2)}_{\text{parton densities, non-perturbative}},$$

Different flavor contributions to $F_2(x, Q^2)$:

	light flavor	heavy flavor
LO:	$x[f_q + f_{\bar{q}}] _{q=u,d,s}$	$a_s \left[C_g^{(1),H} \otimes xg \right]$
NLO:	$a_s \left[C_q^{(1)} \otimes x[f_q + f_{\bar{q}}] + C_g^{(1)} \otimes xg \right]$	$a_s^2 \left[C_{q,NS}^{(2),H} \otimes x[f_q + f_{\bar{q}}] + C_{q,PS}^{(2),H} \otimes x\Sigma + C_g^{(2),H} \otimes xg \right]$
N ² LO:	⋮	⋮

3-loop analysis: $O(a_s^3)$ heavy flavor Wilson coefficients needed.

Need for the calculation:

- **Heavy flavor** (charm) contributions to DIS **structure functions** are rather large [20–40 % at lower values of x].
- Increase in accuracy of the perturbative description of DIS **structure functions**.
- \iff QCD analysis and determination of Λ_{QCD} , resp. $\alpha_s(M_Z^2)$, from DIS data:
 $\delta\alpha_s/\alpha_s < 1\%$.
- \iff Precise determination of the **gluon** and **sea quark** distributions.
- \iff Derivation of **variable flavor number scheme** for **heavy quark** production to $O(\alpha_s^3)$.

Goal:

Calculation of the **heavy flavor Wilson coefficients** to higher orders for $Q^2 \geq 25 \text{ GeV}^2$ [sufficient in many applications].

[Thompson, 2007]

High statistics in both cases

$F_2^{c\bar{c}}(x, Q^2) \sim 20 - 40\% F_2(x, Q^2)$ for small values of x , but **different** scaling violations

Different Scaling Violations for $F_2^{\text{light}}(x, Q^2)$ and $F_2^{c\bar{c}}(x, Q^2)$.

Previous calculations:

Unpolarized DIS :

- **LO** : [Witten, 1976; Babcock, Sivers, 1978; Shifman, Vainshtein, Zakharov 1978; Leveille, Weiler, 1979]
- **NLO** : [Laenen, Riemersma, Smith, van Neerven, 1993, 1995]
asymptotic: [Buza, Matiounine, Smith, Migneron, van Neerven, 1996; Bierenbaum, Blümlein, Klein, 2007]
- **Observation:** $F_2^{c\bar{c}}(x, Q^2)$ is very well described by $F_2^{c\bar{c}}(x, Q^2)|_{Q^2 \gg m^2}$ for $Q^2 \gtrsim 10 m_c^2$.

Polarized DIS :

- **LO** : [Watson, 1982; Glück, Reya, Vogelsang, 1991; Vogelsang, 1991]
- **NLO** :
asymptotic: [Buza, Matiounine, Smith, van Neerven, 1997; Bierenbaum, Blümlein, Klein, 2008, to appear]

Mellin–space expressions: [Alekhin, Blümlein, 2003].

Variable flavor number scheme at $O(\alpha_s^2)$: [Buza, Matiounine, Smith, van Neerven, 1998]

In the following, we report on results for unpolarized and polarized Heavy Flavor Wilson coefficients beyond NLO.

2. The Method

- massless RGE and light-cone expansion in Bjorken-limit $\{Q^2, \nu\} \rightarrow \infty$, x fixed:

$$\lim_{\xi^2 \rightarrow 0} [J(\xi), J(0)] \propto \sum_{i,N,\tau} c_{i,\tau}^N(\xi^2, \mu^2) \xi_{\mu_1} \dots \xi_{\mu_N} O_{i,\tau}^{\mu_1 \dots \mu_m}(0, \mu^2) .$$

- Operators: flavor non-singlet (≤ 3), pure-singlet and gluon; consider leading twist.
- RGE for collinear singularities
 \implies mass factorization of the structure functions into Wilson coefficients and parton densities:

$$F_i(x, Q^2) = \sum_j \underbrace{C_i^j \left(x, \frac{Q^2}{\mu^2} \right)}_{\text{perturbative}} \otimes \underbrace{f_j(x, \mu^2)}_{\text{non-perturbative}}$$

- Light-flavor Wilson coefficients: process dependent

$$C_{(2,L);i}^{\text{fl}} \left(\frac{Q^2}{\mu^2} \right) = \delta_{i,q} + \sum_{l=1}^{\infty} a_s^l C_{(2,L),i}^{\text{fl},(l)}, \quad i = q, g$$

\implies Known up to $O(a_s^3)$ [Moch, Vermaseren, Vogt, 2005.]

- Heavy quark contributions given by heavy quark Wilson coefficient, $H_{(2,L),i}^{\text{S,NS}} \left(\frac{Q^2}{\mu^2}, \frac{m^2}{Q^2} \right)$.
- In the limit $Q^2 \gg m_Q^2$ [$Q^2 \approx 10 m_Q^2$ for F_2]:
massive RGE, derivative $m^2 \partial / \partial m^2$ acts on Wilson coefficients only: all terms but power corrections calculable through **partonic operator matrix elements**, $\langle i | A_l | j \rangle$, which are **process independent objects!**

$$H_{(2,L),i}^{\text{S,NS}} \left(\frac{Q^2}{\mu^2}, \frac{m^2}{\mu^2} \right) = \underbrace{A_{k,i}^{\text{S,NS}} \left(\frac{m^2}{\mu^2} \right)}_{\text{massive OMEs}} \otimes \underbrace{C_{(2,L),k}^{\text{S,NS}} \left(\frac{Q^2}{\mu^2} \right)}_{\text{light-parton-Wilson coefficients}}.$$

- holds for **polarized** and **unpolarized** case. OMEs obey expansion

$$A_{k,i}^{\text{S,NS}} \left(\frac{m^2}{\mu^2} \right) = \langle i | O_k^{\text{S,NS}} | i \rangle = \delta_{k,i} + \sum_{l=1}^{\infty} a_s^l A_{k,i}^{\text{S,NS},(l)} \left(\frac{m^2}{\mu^2} \right), \quad i = q, g$$

[Buza, Matiounine, Migneron, Smith, van Neerven, 1996; Buza, Matiounine, Smith, van Neerven, 1997.]

3. Renormalization

Unrenormalized massive operator matrix elements:

$$\hat{A}_{ij} = \delta_{ij} + \sum_{k=0}^{\infty} \hat{a}_s^k \hat{A}_{ij}^{(k)}$$

need for:

- Mass renormalization
- Charge renormalization
- Renormalization of ultraviolet singularities
- Factorization of collinear singularities

→ use $\overline{\text{MS}}$ scheme and decoupling formalism [Ovrut, Schnitzer 1981; Bernreuther, Wetzel 1982].

Since the light-cone expansion is used, external legs obtain self-energy insertions due to heavy quarks.

Mass renormalization:

on-mass-shell scheme for quarks

[Tarrach 1981; Nachtmann, Wetzel 1981; Gray, Broadhurst, Graefe, Schilcher 1990]

$$\hat{m} = m + \hat{a}_s \delta m_1 + \hat{a}_s^2 \delta m_2 + O(\hat{a}_s^3)$$

$$\delta m_1 = C_F S_\varepsilon m \left(\frac{m^2}{\mu^2} \right)^{\varepsilon/2} \left[\frac{6}{\varepsilon} - 4 + \left(4 + \frac{3}{4} \zeta_2 \right) \varepsilon \right]$$

$$\delta m_2 = C_F S_\varepsilon^2 m \left(\frac{m^2}{\mu^2} \right)^\varepsilon \left[\frac{1}{\varepsilon^2} (18C_F + 22C_A - 8T_F(N_l + N_h)) + \frac{1}{\varepsilon} \left(-\frac{45}{2}C_F + \frac{91}{2}C_A - 14T_F(N_l + N_h) \right) \right. \\ \left. + C_F \left(\frac{199}{8} - \frac{51}{2}\zeta_2 + 48 \ln(2)\zeta_2 - 12\zeta_3 \right) + C_A \left(-\frac{605}{8} + \frac{5}{2}\zeta_2 - 24 \ln(2)\zeta_2 + 6\zeta_3 \right) + T_F \left[N_l \left(\frac{45}{2} + 10\zeta_2 \right) + N_h \left(\frac{69}{2} - 14\zeta_2 \right) \right] \right]$$

Charge renormalization: $\overline{\text{MS}}$ -scheme

$$\hat{a}_s(\varepsilon) = Z_g^2(\varepsilon, \mu^2) a_s(\mu^2) = a_s(\mu^2) \left[1 + \delta a_{s,1} a_s(\mu^2) + \delta a_{s,2} a_s^2(\mu^2) \right] + O(a_s^4)$$

$$\delta a_{s,1} = S_\varepsilon \frac{2\beta_0}{\varepsilon}, \quad \delta a_{s,2} = S_\varepsilon^2 \left[\frac{4\beta_0^2}{\varepsilon^2} + \frac{\beta_1}{\varepsilon} \right]$$

Operator renormalization:

ultraviolet divergences, renormalized by Z -factors.

Generic formula in terms of anomalous dimensions $\gamma_{ij,k}$. Has to be adapted e.g. for the various cases – three-loop non-singlet, pure-singlet, etc. ($i, j, m, n \in \{q, g\}$):

$$\begin{aligned}
 Z_{ij}(N, a_s, \varepsilon) = & \delta_{i,j} + a_s S_\varepsilon \frac{\gamma_{ij,0}}{\varepsilon} + a_s^2 S_\varepsilon^2 \left\{ \frac{1}{\varepsilon^2} \left[\frac{1}{2} \gamma_{im,0} \gamma_{mj,0} + \beta_0 \gamma_{ij,0} \right] + \frac{1}{2\varepsilon} \gamma_{ij,1} \right\} \\
 & + a_s^3 S_\varepsilon^3 \left\{ \frac{1}{\varepsilon^3} \left[\frac{1}{6} \gamma_{in,0} \gamma_{nm,0} \gamma_{mj,0} + \beta_0 \gamma_{im,0} \gamma_{mj,0} + \frac{4}{3} \beta_0^2 \gamma_{ij,0} \right] \right. \\
 & + \frac{1}{\varepsilon^2} \left[\frac{1}{6} (\gamma_{im,1} \gamma_{mj,0} + 2\gamma_{im,0} \gamma_{mj,1}) + \frac{2}{3} (\beta_0 \gamma_{ij,1} + \beta_1 \gamma_{ij,0}) \right] \\
 & \left. + \frac{\gamma_{ij,2}}{3\varepsilon} \right\}
 \end{aligned}$$

$$Z_{qq}^{PS} = Z_{qq} - Z_{NS}.$$

The anomalous dimensions $\gamma_{ij,k}(N)$ are related to the splitting functions by

$$\gamma_{ij,k}(N) = - \int_0^1 dz z^{N-1} P_{ij}^{(k)}(z) .$$

Mass factorization: Collinear singularities are factored into Γ_{NS} , $\Gamma_{ij,S}$ and $\Gamma_{qq,PS}$.

For massless quarks: $\Gamma_{NS} = Z_{NS}^{-1}$, $\Gamma_{ij,S} = Z_{ij,S}^{-1}$, $\Gamma_{qq,PS} = Z_{qq,PS}^{-1}$

$$\begin{aligned}\Gamma_{NS}(N, a_s, \varepsilon) &= 1 - a_s S_\varepsilon \frac{\gamma_{NS,0}}{\varepsilon} + a_s^2 S_\varepsilon^2 \left[\frac{1}{\varepsilon^2} \left(\frac{1}{2} \gamma_{NS,0}^2 - \beta_0 \gamma_{NS,0} \right) - \frac{1}{2\varepsilon} \gamma_{NS,1} \right] \\ \Gamma_{ij,S}(N, a_s, \varepsilon) &= \delta_{ij} - a_s S_\varepsilon \frac{\gamma_{ij,0}}{\varepsilon} + a_s^2 S_\varepsilon^2 \left[\frac{1}{\varepsilon^2} \left(\frac{1}{2} \gamma_{ik,0} \gamma_{kj,0} - \beta_0 \gamma_{ij,0} \right) - \frac{1}{2\varepsilon} \gamma_{ij,1} \right] \\ \Gamma_{qq,PS}(N, a_s, \varepsilon) &= -a_s^2 S_\varepsilon^2 \left[\frac{1}{2\varepsilon^2} \gamma_{qq,0} \gamma_{qq,0} + \frac{1}{2\varepsilon} \gamma_{qq,PS,1} \right].\end{aligned}$$

Here: in each diagram at least one quark line is massive

\Rightarrow Γ -matrices apply to parts of the diagrams with massless lines only

\leftrightarrow at most 2-loop sub-graphs

\leftrightarrow mass factorization is different in various sub-classes of contributing Feynman diagrams

\rightarrow singularities contained in Γ_{NS} , $\Gamma_{ij,S}$, and $\Gamma_{qq,PS}$ are absorbed into the bare parton densities, which become scale-dependent

The renormalized operator matrix elements are obtained removing the ultraviolet singularities and collinear singularities of the operator matrix elements,

$$A_{ij} = Z_{ik}^{-1} \hat{A}_{kl} \Gamma_{lj}^{-1} = \delta_{ij} + a_s A_{ij}^{(1)} + a_s^2 A_{ij}^{(2)} + a_s^3 A_{ij}^{(3)} .$$

For example:

$$A_{Qg} = Z_{qq}^{-1} \hat{A}_{Qq}^{PS} \Gamma_{qq}^{-1} + Z_{qq}^{-1} \hat{A}_{Qg} \Gamma_{gg}^{-1} + Z_{qq}^{-1} \hat{A}_{gq,Q} \Gamma_{qq}^{-1} + Z_{qq}^{-1} \hat{A}_{gg,Q} \Gamma_{gg}^{-1} .$$

$$\implies A_{Qg}^{(2)} = \hat{A}_{Qg}^{(2)} + Z_{qq}^{-1,(1)} \hat{A}_{Qg}^{(1)} + Z_{qq}^{-1,(1)} \hat{A}_{gg,Q}^{(1)} + Z_{qq}^{-1,(2)} + \left(\hat{A}_{Qg}^{(1)} + Z_{qq}^{-1,(1)} \right) \Gamma_{gg}^{-1,(1)} .$$

→ mixing with \hat{A}_{Qq}^{PS} and $\hat{A}_{gg,Q}$ at $O(a_s^3)$.

→ $\hat{A}_{gq,Q}$ starts contributing from $O(a_s^2) \Rightarrow$ at $O(a_s^4)$ to \hat{A}_{Qg}

For example: **Renormalized gluonic massive operator matrix elements** up to $O(a_s^2)$:

$$\begin{aligned}
 \text{Unrenormalized } \hat{A}_{Qg} \text{ to } O(a_s^2): \\
 \hat{A}_{Qg}^{(1)} &= S_\varepsilon \left(\frac{m^2}{\mu^2} \right)^{\varepsilon/2} \left\{ -\frac{1}{\varepsilon} \hat{P}_{qg}^{(0)} + a_{Qg}^{(1)} + \varepsilon \bar{a}_{Qg}^{(1)} + \varepsilon^2 \bar{\bar{a}}_{Qg}^{(1)} \right\} \\
 \hat{A}_{Qg}^{(2)} &= S_\varepsilon^2 \left(\frac{m^2}{\mu^2} \right)^\varepsilon \left[\frac{1}{\varepsilon^2} \left\{ \frac{1}{2} \hat{P}_{qg}^{(0)} \otimes (P_{qq}^{(0)} - P_{gg}^{(0)}) + \beta_0 \hat{P}_{qg}^{(0)} \right\} \right. \\
 &\quad \left. + \frac{1}{\varepsilon} \left\{ -\frac{1}{2} \hat{P}_{qg}^{(1)} - 2\beta_0 a_{Qg}^{(1)} - a_{Qg}^{(1)} \otimes (P_{qq}^{(0)} - P_{gg}^{(0)}) \right\} + a_{Qg}^{(2)} + \varepsilon \bar{a}_{Qg}^{(2)} \right] \\
 &\quad - \frac{2}{\varepsilon} S_\varepsilon \sum_{H=Q}^t \beta_{0,H} \left(\frac{m_H^2}{\mu^2} \right)^{\varepsilon/2} \left(1 + \frac{1}{8} \varepsilon^2 \zeta_2 + \frac{\varepsilon^3}{24} \zeta_3 \right)
 \end{aligned}$$

$$\begin{aligned}
 \text{Renormalized } A_{Qg} \text{ to } O(a_s^2): \\
 A_{Qg}^{(1)} &= -\frac{1}{2} \hat{P}_{qg}^{(0)} \ln \left(\frac{m^2}{\mu^2} \right) \\
 A_{Qg}^{(2)} &= \frac{1}{8} \left\{ \hat{P}_{qg}^{(0)} \otimes [P_{qq}^{(0)} - P_{gg}^{(0)} + 2\beta_0] \right\} \ln^2 \left(\frac{m^2}{\mu^2} \right) - \frac{1}{2} \hat{P}_{qg}^{(1)} \ln \left(\frac{m^2}{\mu^2} \right) \\
 &\quad + \bar{a}_{Qg}^{(1)} [P_{qq}^{(0)} - P_{gg}^{(0)} + 2\beta_0] + a_{Qg}^{(2)} \quad ; \quad a_{Qg}^{(1)} \equiv 0
 \end{aligned}$$

- $\bar{a}_{Qg}^{(1)}$: $O(\varepsilon)$ of the OME $A_{Qg}^{(1)}$ in the $\overline{\text{MS}}$ -scheme. Enters $A_{Qg}^{(2)}$ through renormalization.
- For the renormalization of $A_{Qg}^{(3)}$: $\bar{a}_{Qg}^{(2)}$, $\bar{a}_{gg,Q}^{(2)}$, $\bar{a}_{Qq}^{(2),\text{PS}}$ are needed.

4. Calculation Techniques

- Calculation in **Mellin-space** for **space-like** q^2 , $Q^2 = -q^2$: $0 \leq x \leq 1$
- use of **generalized hypergeometric functions** for general analytic results
- use of **Mellin-Barnes integrals** for numerical checks (**MB**, [Czakon, 2006]) and some analytic results
- Summation of lots of **new** infinite **one-parameter sums** into **harmonic sums**. E.g.:

$$N \sum_{i,j=1}^{\infty} \frac{S_1(i)S_1(i+j+N)}{i(i+j)(j+N)} = 4S_{2,1,1} - 2S_{3,1} + S_1 \left(-3S_{2,1} + \frac{4S_3}{3} \right) - \frac{S_4}{2} \\ - S_2^2 + S_1^2 S_2 + \frac{S_1^4}{6} + 6S_1 \zeta_3 + \zeta_2 (2S_1^2 + S_2) .$$

use of **integral techniques** and the **Mathematica package SIGMA** [C. Schneider, 2007],
[I. Bierenbaum, J. Blümlein, S. Klein, C. Schneider, arXiv:0707.4659 [math-ph];
arXiv:0803.0273 [hep-ph]]

- Partial checks for fixed values of N using **SUMMER**,
[Vermaseren, Int. J. Mod. Phys. A **14** (1999)].
- Algebraic and structural simplification of the harmonic sums [J. Blümlein, 2003, 2007].

5. Results

Unpolarized case, Singlet, $O(\varepsilon)$

$$\begin{aligned}
 \bar{a}_{Qg}^{(2)} = & T_F C_F \left\{ \frac{2}{3} \frac{(N^2 + N + 2)(3N^2 + 3N + 2)}{N^2(N+1)^2(N+2)} \zeta_3 + \frac{P_1}{N^3(N+1)^3(N+2)} S_2 + \frac{N^4 - 5N^3 - 32N^2 - 18N - 4}{N^2(N+1)^2(N+2)} S_1^2 \right. \\
 & + \frac{N^2 + N + 2}{N(N+1)(N+2)} \left(16S_{2,1,1} - 8S_{3,1} - 8S_{2,1}S_1 + 3S_4 - \frac{4}{3}S_3S_1 - \frac{1}{2}S_2^2 - S_2S_1^2 - \frac{1}{6}S_1^4 + 2\zeta_2S_2 - 2\zeta_2S_1^2 - \frac{8}{3}\zeta_3S_1 \right) \\

[I. Bierenbaum, J. Blümlein and S. Klein, 2008, to appear]

Polarized case, Pure-Singlet and Non-singlet, $O(\varepsilon)$

$$\Delta \bar{a}_{Qq}^{\text{PS},(2)} = -\frac{4(N-1)(N+2)}{3N^2(N+1)^2} (3S_3 + \zeta_3) + 2\frac{(N+2)(N^3+2N+1)}{N^3(N+1)^3} (2S_2 + \zeta_2) + 2\frac{(2+N)(N^5-7N^4+6N^3+7N^2+4N+1)}{(N+1)^5 N^5},$$

$$\Delta \bar{a}_{qq,Q}^{\text{NS},(2)} = \bar{a}_{qq,Q}^{\text{NS},(2)}.$$

- Use of 't Hooft–Veltman–scheme for γ_5 . A **finite renormalization** has to be applied to maintain the **Ward-identities**.
- The first moment of $\Delta \bar{a}_{Qg}^{(2)}$ vanishes. \implies sum rule of $\Delta H_g(x)$.

$\hat{A}_{gg,Q}^{(2)}$ unpolarized

$$\begin{aligned}
\hat{A}_{gg,Q}^{(2)} = & \\
& T_F C_A \left\{ \frac{1}{\varepsilon^2} \left(-\frac{32}{3} S_1 + \frac{64(N^2 + N + 1)}{3(N-1)N(N+1)(N+2)} \right) + \frac{1}{\varepsilon} \left(-\frac{80}{9} S_1 + \frac{16P_1}{9(N-1)N^2(N+1)^2(N+2)} \right) \right. \\

\end{aligned}$$

→ Result obtained in terms of Γ and Ψ functions to **all orders in ε**

→ to **$O(\varepsilon^0)$ agreement** with van Neerven et al.

→ **$O(\varepsilon)$ new:** term needed too to derive **variable flavor number scheme** to $O(\alpha_s^3)$.

A remark on the mathematical structure of the $O(1)$ and $O(\varepsilon)$ terms:

van Neerven et al. to $O(1)$: unpolarized: 48 basic functions; polarized: 24 basic functions.

$O(1)$: $\{S_1, S_2, S_3, S_{-2}, S_{-3}\}, S_{-2,1} \implies 2$ basic objects.

$O(\varepsilon)$: $\{S_1, S_2, S_3, S_4, S_{-2}, S_{-3}, S_{-4}\}, S_{2,1}, S_{-2,1}, S_{-3,1}, S_{2,1,1}, S_{-2,1,1}$
 $\implies 6$ basic objects

These objects are in common to all single scale higher order processes.

Str. Functions, DIS HQ, Fragm. Functions, DY, Hadr. Higgs-Prod., s+v contr. to Bhabha scatt., ...

harmonic sums with index $\{-1\}$ cancel (holds even for each diagram)

[J. Blümlein, 2004; J. Blümlein, V. Ravindran, 2005,2006; J. Blümlein, S. Klein, arXiv: 0706.2426 [hep-ph];

J. Blümlein and S. Moch in preparation.]

Expectation for 3-loops: weight 5 (6) harmonic sums

6. Fixed moments of $A_{ij,Q}^{(3)}$

Contributing OMEs:

$$\begin{array}{lcl}
 \text{Singlet} & A_{Qg} & A_{gg,Q} & A_{qq,Q} \\
 \text{Pure-Singlet} & & A_{Qq}^{\text{PS}} & \\
 \text{Non-Singlet} & A_{qq,Q}^{\text{NS,+}} & A_{qq,Q}^{\text{NS,-}} & A_{qq,Q}^{\text{NS,v}}
 \end{array}
 \left. \vphantom{\begin{array}{lcl} \text{Singlet} \\ \text{Pure-Singlet} \\ \text{Non-Singlet} \end{array}} \right\} \text{mixing}$$

- All 2-loop $O(\varepsilon)$ -terms in the **unpolarized** case are known:

$$\bar{a}_{Qg}^{(2)}, \bar{a}_{Qq}^{(2),\text{PS}}, \bar{a}_{gg,Q}^{(2)}, \bar{a}_{qq,Q}^{(2)}, \bar{a}_{qq,Q}^{(2),\text{NS}}.$$

- Unpolarized anomalous dimensions** are known up to $O(a_s^3)$ [Moch, Vermaseren, Vogt, 2004.]

\implies All terms needed for the renormalization of **unpolarized 3-Loop heavy OMEs** are present.

\implies Calculation will provide first independent checks on $\gamma_{qg}^{(3)}$, $\gamma_{qq}^{(3),\text{PS}}$ and on respective color projections of $\gamma_{qq}^{(3),\text{NS}\pm,\text{v}}$, $\gamma_{gg}^{(3)}$ and $\gamma_{gq}^{(3)}$.

- Calculation proceeds in the same way in the **polarized** case. Known so far :

$$\Delta \bar{a}_{Qg}^{(2)}, \Delta \bar{a}_{Qq}^{(2),\text{PS}}, \Delta \bar{a}_{qq,Q}^{(2),\text{NS}} = \bar{a}_{qq,Q}^{(2),\text{NS}}.$$

- 3-loop OMEs are generated with QGRAF [Nogueira 1993]
- New operator insertions emerge:

We consider first the terms with 2 quark loops (at least one heavy): # of diagrams for $A_{Qg}^{(3)}$

- 489 diagrams with two quark loops
- 1478 diagrams with one quark loop

\implies number of diagrams can be reduced by using symmetry arguments.

First step: Calculation of **fixed moments** of $A_{ij}^{(3)}(N)$, $N = 2, 4, 6, \dots$

- three-loop “self-energy” type diagrams with an operator insertion
- **Extension:** **additional scale** compared to massive propagators: **Mellin variable N**
- Genuine **tensor integrals** due to

$$\Delta^{\mu_1} \dots \Delta^{\mu_n} \langle p | O_{\mu_1 \dots \mu_n} | p \rangle = \Delta^{\mu_1} \dots \Delta^{\mu_n} \langle p | S \bar{\Psi} \gamma_{\mu_1} D_{\mu_2} \dots D_{\mu_n} \Psi | p \rangle = A(N) \cdot (\Delta p)^N$$

$$D_\mu = \partial_\mu - ig t_a A_\mu^a, \quad \Delta^2 = 0.$$

- Construction of a **projector** to obtain the desired moment in **N** [undo Δ -contraction] ✓
- Color factors are calculated with [Ritbergen, Schellekens, Vermaseren 1998]
- Translation to suitable input for **MATAD** [Steinhauser, 2001] ✓

Tests performed : Various 2-loop calculations for $N = 2, 4, 6, \dots$ for A_{Qg} were repeated
 → agreement with our previous calculation; checked against result of $A_{gg,Q}^{(2)}$

- automated chain to evaluate the OMEs ✓
- Terms $\propto O(T_F^2 d_{abc} d^{abc})$ vanish
- **currently investigated:** terms $\propto T_F^2 C_F, T_F^2 C_A$ -terms

First Results

Non-singlet terms : $O(T_F^2 C_F)$ $A_{qq,Q}^{(3),NS^\pm}(N)$: 2 heavy quark loops

7. Conclusions

- The **heavy flavor contributions** to F_2 are **rather large** in the region of lower values of x .
- **QCD precision analyses** therefore require the description of the heavy quark contributions to **3-loop order**.
- We calculate the **heavy flavor DIS Wilson Coefficients** in the asymptotic regime [$Q^2 \geq 10m^2$] using massive operator matrix elements.
- We **newly** presented **first contributions** to these corrections:
 - $\bar{a}_{Qg}^{(2)}, \bar{a}_{Qq}^{PS,(2)}, \bar{a}_{gg,Q}^{(2)}, \bar{a}_{qq}^{NS,(2)} = \Delta\bar{a}_{qq,Q}^{NS,(2)}$
 - $\Delta\bar{a}_{Qg}^{(2)}, \Delta\bar{a}_{Qg}^{PS,(2)}$

in the **unpolarized and polarized case** for **general values of the Mellin variable**. These terms contribute to $H_{ij}^{(3)}, \Delta H_{ij}^{(3)}$ respectively, through renormalization.

- The calculation is performed in **Mellin space**, which allows to obtain compact results.
 - The **analytic results** were obtained using representations in terms of **generalized hypergeometric functions**.
 - Numerical checks were performed applying **Mellin–Barnes integrals**.
- **Integral techniques** and the summation package **SIGMA** have been used for summation. The results are given in the form of **nested harmonic sums**.
- We developed a programme–chain to calculate the massive operator matrix elements $A_{ij}^{(3)}$ for **fixed Mellin moments** based on **QGRAF** and **MATAD**
- **First non-logarithmic 3–loop contributions** were calculated for a series of Mellin Moments. There are more to come soon for other color structures and higher values of Mellin N .
- The **3–loop anomalous dimensions** are obtained as a **by-product** from the single pole terms.
- The **The complete results for a series of moments will be obtained after several months**.
- **⇒ first phenomenology possible by then.**
- **Next Goal: Result for General values of N**
