Example of electroweak corrections

- Electroweak corrections to di-jet production $(\mathcal{O}(\alpha\alpha_s^2))$
 - EW vertex correction

EW box correction

Electroweak corrections enhanced via Sudakov logarithms

- Electroweak corrections at the LHC can be enhanced at high energies due to soft/collinear radiation of W and Z bosons.
- When all kinematic invariants $r_{ij} = (p_i + p_k)^2$ are much larger than the heavy particles in the loop, i.e., $|r_{ij}| \sim Q^2 \gg M_W^2 \sim M_Z^2 \sim M_H^2 \sim m_t^2$, electroweak corrections are dominated by Sudakov-like corrections:

$$\boxed{\alpha_W^l \log^n(Q^2/M_W^2) \quad (n \le 2l, \ \alpha_W = \frac{\alpha}{4\pi s_W^2})}$$

- $\triangleright Q = 1 \text{TeV}.$ $\alpha_W \log^2(Q^2/M_W^2) \sim 6.6\%$, $\alpha_W \log(Q^2/M_W^2) \sim 1.3\%$
- ightharpoonup Q = 14 TeV, $DL \sim 27\%$

 $SL \sim 2.6\%$

Why electroweak corrections?

- The inclusion of EW corrections in LHC predictions is important for the search of new physics in tails of distributions, e.g., search for W', Z', non-standard couplings.
- It is also important for contraints on PDFs measurement.
- EW NLO $|\mathcal{O}(\alpha)|$ is expected comparable with QCD NNLO $|\mathcal{O}(\alpha_s^2)|$.

Why electroweak corrections?

- Calculations of electroweak corrections are often not readily available in public codes and can quickly become complicated (and CPU intensive) for high multiplicities.
- As a first step to improve predictions for the LHC at high energies, one could implement the Sudakov approximation of electroweak corrections.

Example: Weak Sudakov corrections to Z + < 3 jets in Alpgen M. Chiesa et al, PRL111 (2013).

- See also a recent proposal to add EW corrections to HERWIG: [http://arxiv.org/pdf/1401.3964.pdf] Link Here
- Our goal is to implement EW corrections in MCFM so that they become readily available to the experimental community and can be studied together with the already implemented QCD corrections.

Processes implemented in MCFM

- We will provide both the Sudakov approximation for EW corrections valid at high energies and the complete 1-loop weak corrections to be able to quantify the goodness of the approximation.

Summary to $t\bar{t}$ production

- We implement EW corrections to the top-pair production in MCFM, making the calculation accessible to the public.
- Both EW Sudakov approximation and exact weak NLO are implemented in MCFM.
- Sudakov approximation works much better in quark-antiquark annihilation channel, in contrary to gluon-fusion channel which has a obvious discrepancy between Sudakov approximation and exact NLO in invariant mass distribution due to the information of angular dependence is missing in Sudakov approximation.
- With a scattering angle cut to gluon-fusion channel, we are able to get an agreement between both calculations.

 - ▶ QCD & EW LO cross sections of $\mathcal{O}(\alpha_s^2, \alpha_s \alpha, \alpha^2)$
 - fixed $\mathcal{O}(\alpha_s^2 \alpha)$:

$$d\hat{\sigma}(\alpha_s^2 \alpha) \propto \begin{cases} 2\text{Re} \left[\mathcal{M}(\alpha_s \alpha) \cdot \mathcal{M}^*(\alpha_s) \right] \\ 2\text{Re} \left[\mathcal{M}(\alpha_s^2) \cdot \mathcal{M}^*(\alpha) \right] \end{cases}$$

Input settings

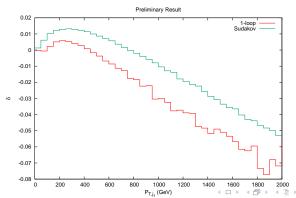

$$G_{\mu} = 1.16637 \times 10^{-5} \,\text{GeV}^{-2},$$

 $M_W = 80.398 \,\text{GeV}, \ M_Z = 91.1876 \,\text{GeV},$
 $\Gamma_W = 2.141 \,\text{GeV}, \ \Gamma_Z = 2.4952 \,\text{GeV},$
 $\mu_R = \mu_F = p_{T,1}.$

Comparison with Sudakov approximation (preliminary)

 Comparison between Sudakov approximation and 1-loop exact calculations at LHC = 14 TeV

$$|p_{T,j}| > 25 \,\text{GeV}, \ |y_j| < 2.5; \ \text{anti} - k_t, \ R = 0.6$$

Conclusion and outlook

- The EW radiative corrections are very important at the LHC due to the Sudakov logarithmic terms.
- We have completed the implementation of both the Sudakov and exact weak NLO corrections to NC-DY and top-pair production into MCFM.
- In top pair production, sudakov approximation works better in quark-antiquark annhilation channel; while it deviates off the exact NLO corrections in gluon-fusion channel due to the missing information on angular dependence.
- The implementation of EW corrections to dijet production in MCFM is ongoing.
- We would like to continue, for instance, with implementation for ZZ/WW production etc.
