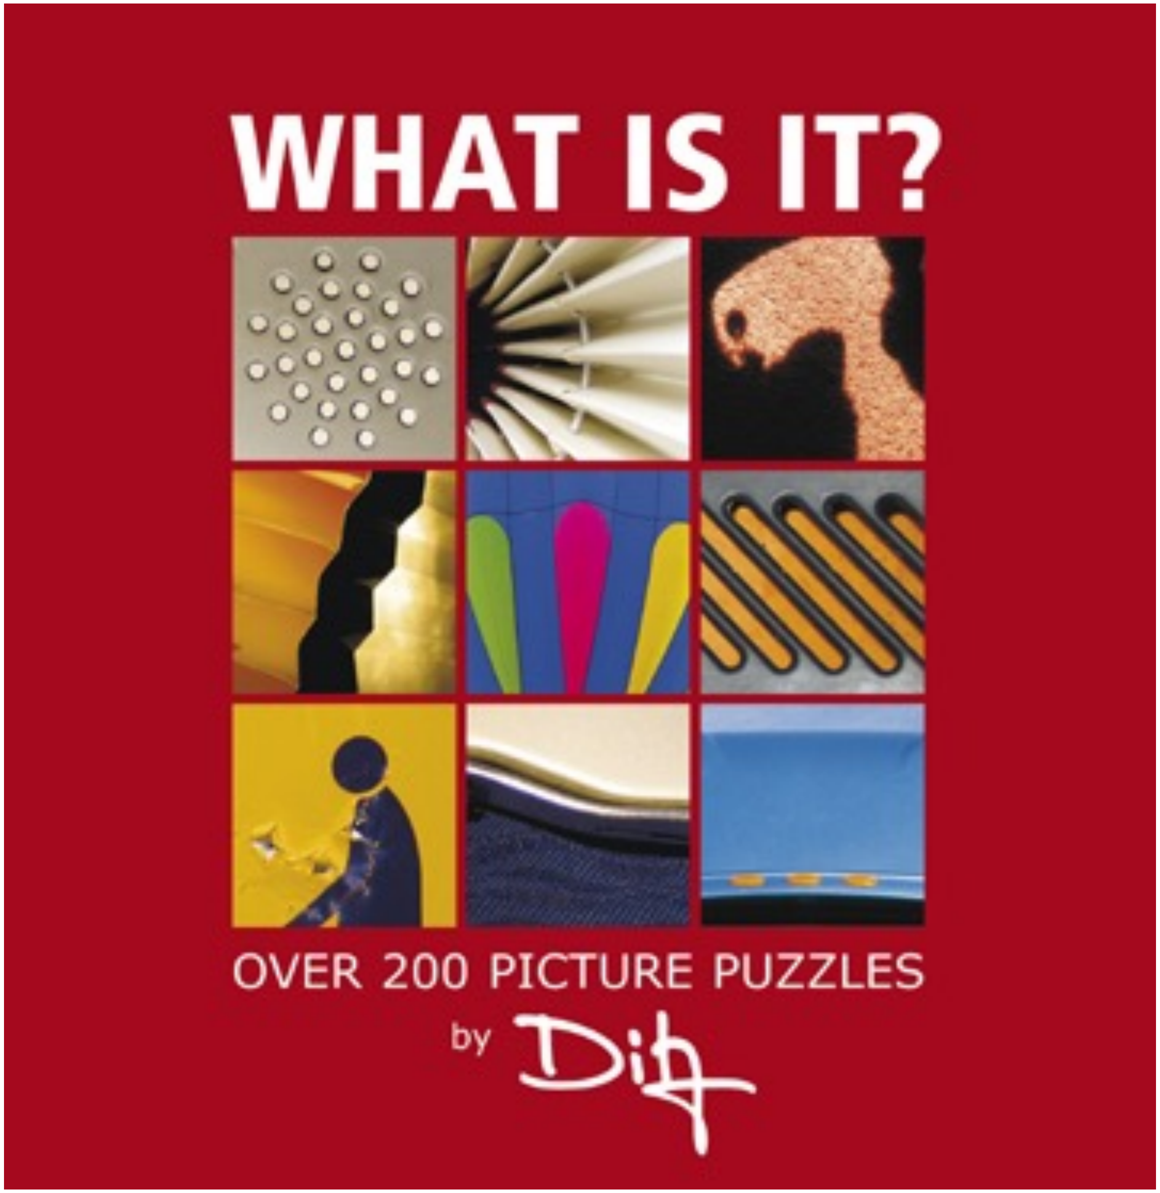
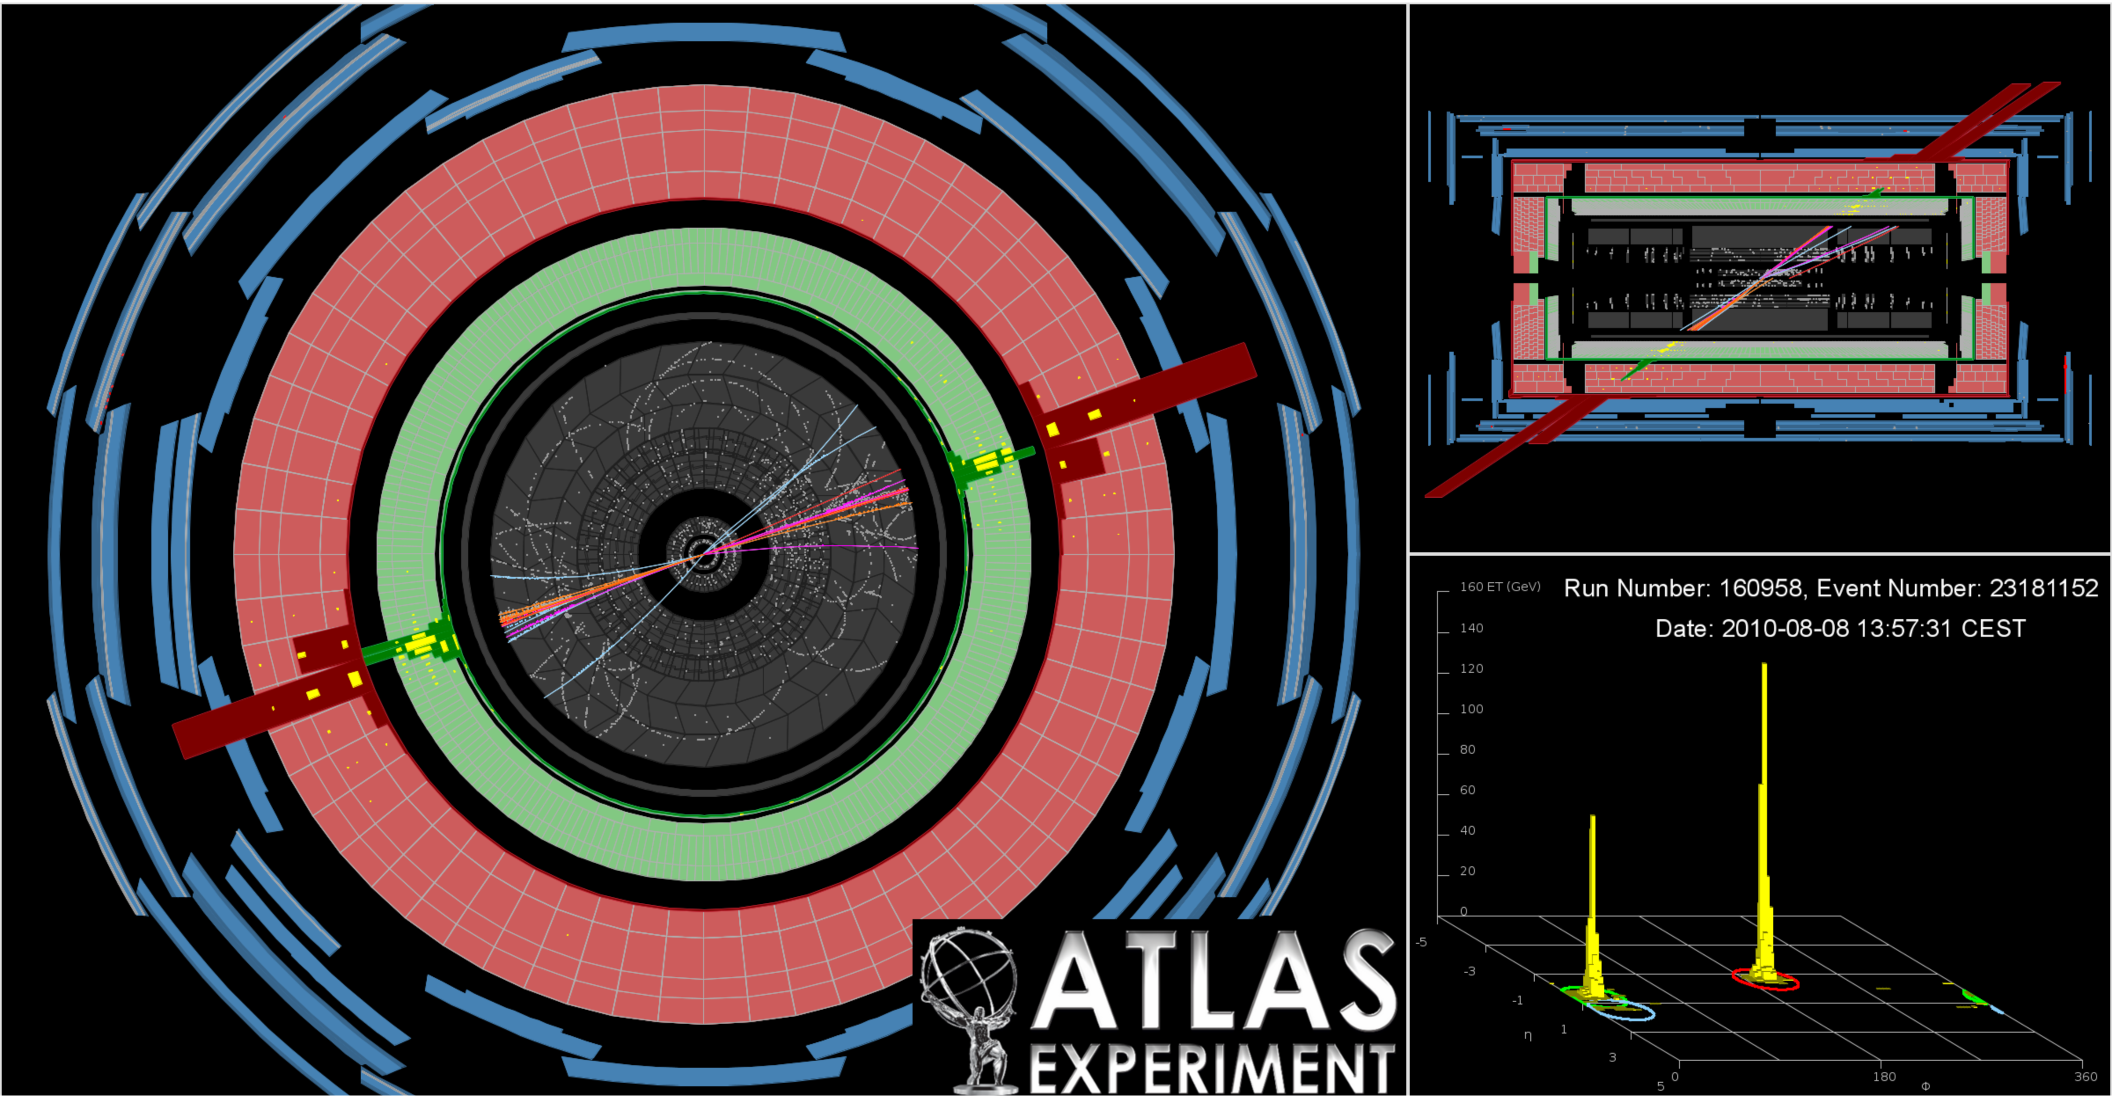
If Any New State Is Seen at LHC:



New State Decaying to Dijets:

How can we quickly tell different dijet resonances apart using straightforward measurements of the dijet state?



Various New Colored States

Gauge bosons from extended color groups:

Classic Axigluon: P.H. Frampton and S.L. Glashow, Phys. Lett. B 190, 157 (1987).

Topgluon: C.T. Hill, Phys. Lett. B 266, 419 (1991).

Flavor-universal Coloron: R.S. Chivukula, A.G. Cohen, & E.H. Simmons, Phys. Lett. B 380, 92 (1996).

Chiral Color with $g_L \neq g_R$: M.V. Martynov and A.D. Smirnov, Mod. Phys. Lett. A 24, 1897 (2009).

New Axigluon: P.H. Frampton, J. Shu, and K. Wang, Phys. Lett. B 683, 294 (2010).

Similar color-octet states:

KK gluon: H. Davoudiasl, J.L. Hewett, and T.G. Rizzo, Phys. Rev. D63, 075004 (2001)
B. Lillie, L. Randall, and L.-T. Wang, JHEP 0709, 074 (2007).

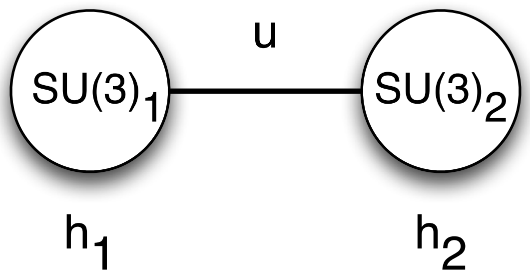
Techni-rho: E. Farhi and L. Susskind, Physics Reports 74, 277 (1981).

More exotic colored states:

Color sextets, colored scalars, low-scale scale string resonances...

T. Han, I. Lewis, Z. Liu, JHEP 1012, 085 (2010).

Coloron Models: Gauge Sector



$SU(3)_1$ x $SU(3)_2$ color sector with $M^2 = \frac{u^2}{4}\begin{pmatrix} h_1^2 & -h_1 h_2 \\ -h_1 h_2 & h_2^2 \end{pmatrix}$

unbroken subgroup: $SU(3)_{1+2} = SU(3)_{QCD}$

$$h_1 = \frac{g_s}{\cos\theta} \qquad h_2 = \frac{g_s}{\sin\theta}$$

gluon state: $G_\mu^A = \cos\theta\, A_{1\mu}^A + \sin\theta\, A_{2\mu}^A$

couples to: $g_S J_G^\mu \equiv g_S(J_1^\mu + J_2^\mu)$ $\qquad M_G = 0$

coloron state: $C_\mu^A = -\sin\theta\, A_{1\mu}^A + \cos\theta\, A_{2\mu}^A$ $\qquad M_C = \frac{u}{\sqrt{2}}\sqrt{h_1^2 + h_2^2}$

couples to: $g_S J_C^\mu \equiv g_S(-J_1^\mu \tan\theta + J_2^\mu \cot\theta)$

Quarks' $SU(3)_1$ x $SU(3)_2$ charges impact phenomenology

Identifying Dijet Resonances

Suppose a new dijet resonance of mass M and cross-section σ_{jj} is found. **Is it a coloron or a leptophobic Z'?** Assume its quark couplings are **flavor universal** to start.

$$\sigma_{jj}^{C} = \frac{8}{9}\frac{\Gamma_C}{M_C^3}\sum_q W_q(M_C) Br(C \to jj)$$

must be equal

$$\sigma_{jj}^{Z'} = \frac{1}{9}\frac{\Gamma_{Z'}}{M_{Z'}^3}\sum_q W_q(M_{Z'}) Br(Z' \to jj)$$

$$W_q(M_V) = 2\pi^2 \frac{M_V^2}{s}\int_{M_V^2/s}^{1}\frac{dx}{x}\left[f_q\left(x,Q^2\right) f_{\bar{q}}\left(\frac{M_V^2}{sx},Q^2\right) + f_{\bar{q}}\left(x,Q^2\right) f_q\left(\frac{M_V^2}{sx},Q^2\right)\right]$$

Color Discriminant Variable

$$\sigma_{jj}^{C} = \frac{8}{9}\frac{\Gamma_C}{M_C^3}\sum_q W_q(M_C)Br(C \to jj)$$

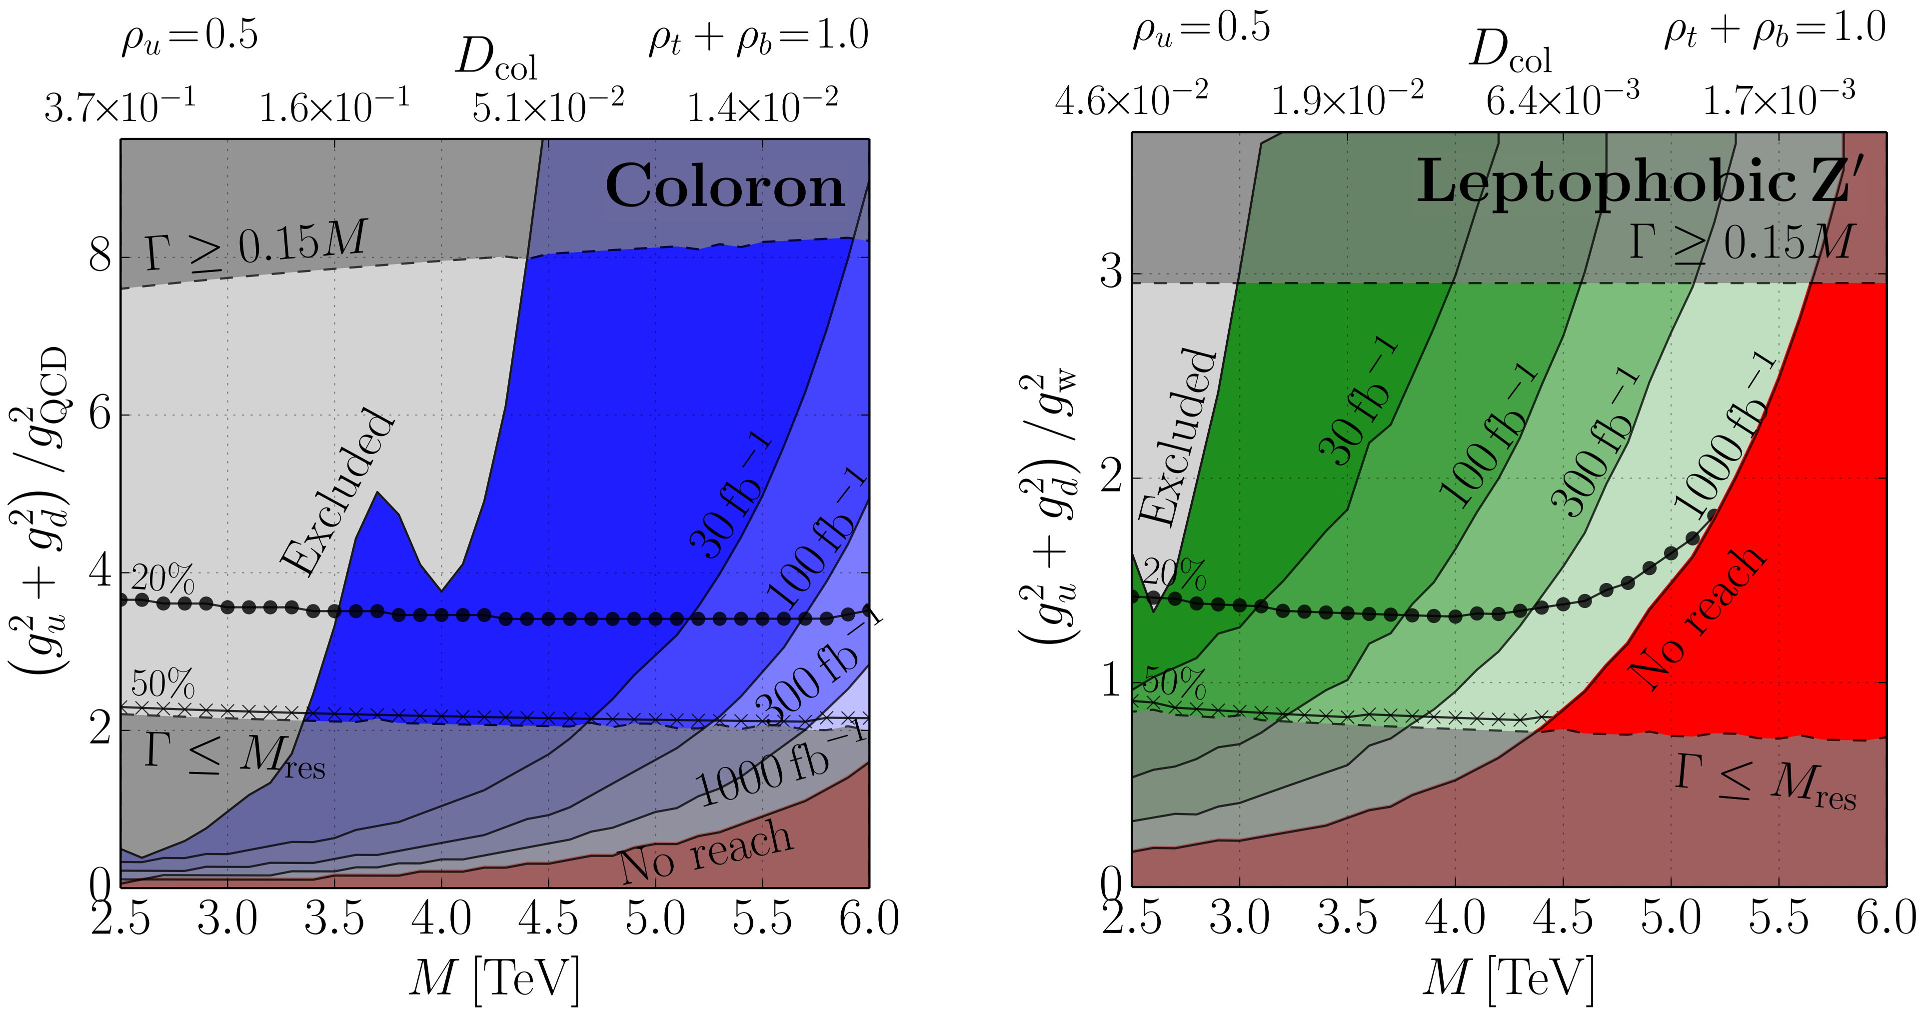
must be equal

$$\sigma_{jj}^{Z'} = \frac{1}{9}\frac{\Gamma_{Z'}}{M_{Z'}^3}\sum_q W_q(M_{Z'})Br(Z' \to jj)$$

Define a color discriminant variable: $D_{\rm col} \equiv \frac{M^3}{\Gamma}\sigma_{jj}$

- based on standard observables
- useful whenever width is measurable
- distinguishes color structure of resonance

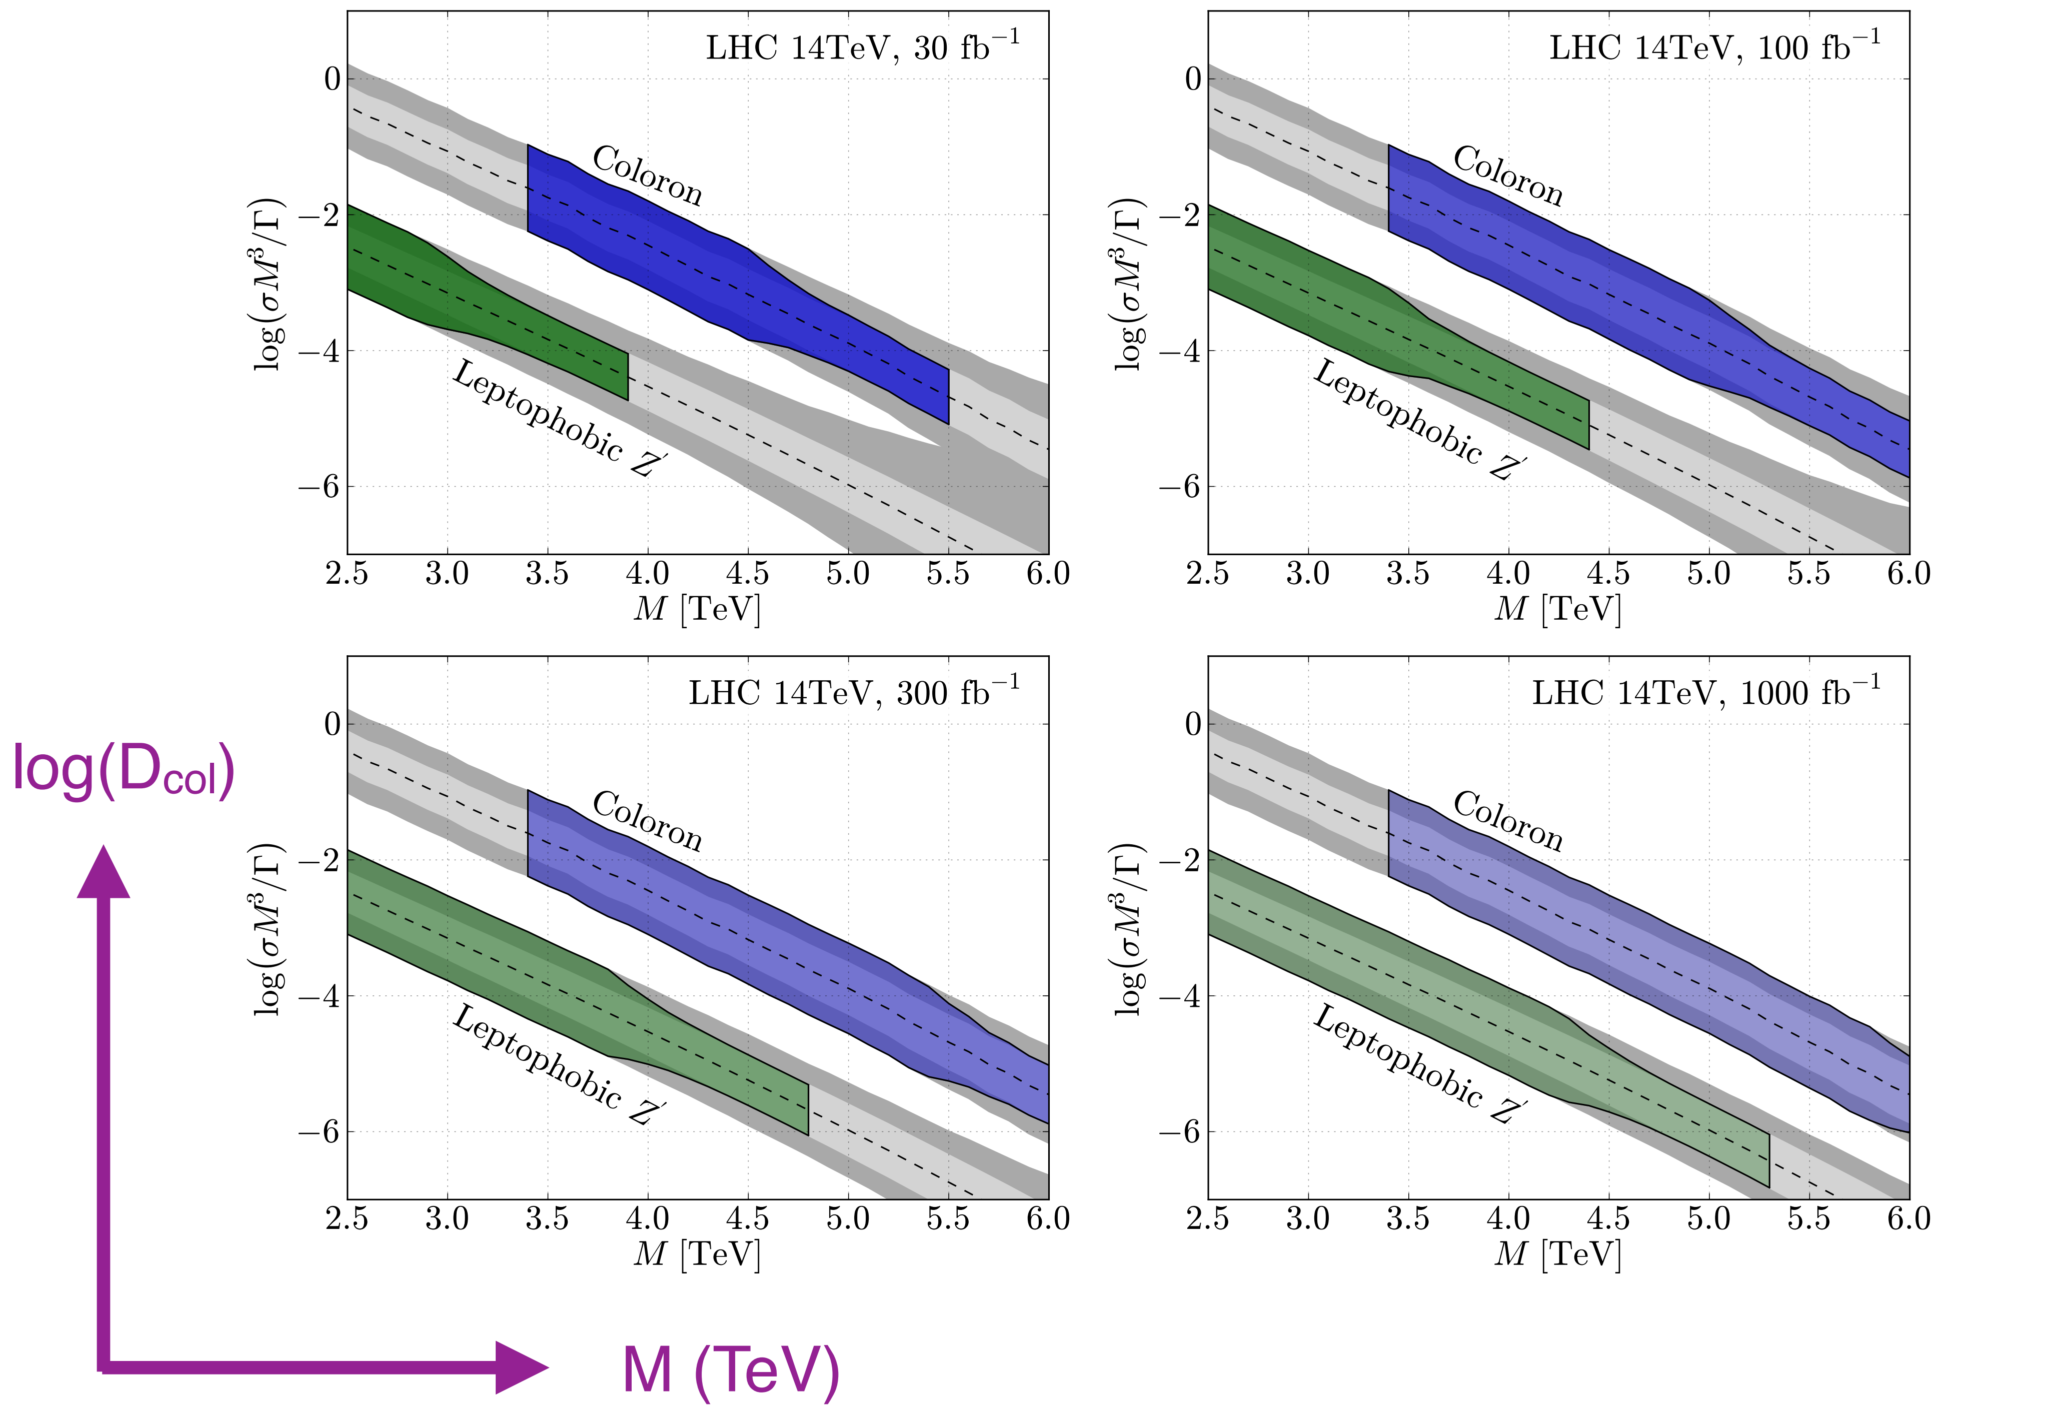
Establish Detection Range



Un-shadowed colored area shows the observable region at LHC

- width is above detector resolution, yet still narrow
- cross-section allows detection, yet is not already excluded

log(D$_{col}$) Separates Coloron from Z'



Beyond Vector Resonances

R.S. Chivukula, EHS, N. Vignaroli

arXiv:1412.3094

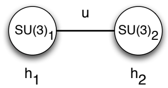
Vector, Fermion, Scalar

Flavor-universal coloron:

Chivukula, Cohen, EHS

Phys. Lett. B 380 (1996) 92

Coloron Models: Gauge Sector



$SU(3)_1 \times SU(3)_2$ color sector with $M^2 = \frac{u^2}{4}\begin{pmatrix} h_1^2 & -h_1 h_2 \\ -h_1 h_2 & h_2^2 \end{pmatrix}$

unbroken subgroup: $SU(3)_{1+2} = SU(3)_{QCD}$

$h_1 = \frac{g_s}{\cos\theta} \qquad h_2 = \frac{g_s}{\sin\theta}$

gluon state: $G^A_\mu = \cos\theta\, A^A_{1\mu} + \sin\theta\, A^A_{2\mu}$

couples to: $g_S J^\mu_G \equiv g_S(J^\mu_1 + J^\mu_2)$ $\qquad M_G = 0$

coloron state: $C^A_\mu = -\sin\theta\, A^A_{1\mu} + \cos\theta\, A^A_{2\mu}$ $\qquad M_C = \frac{u}{\sqrt{2}}\sqrt{h_1^2 + h_2^2}$

couples to: $g_S J^\mu_C \equiv g_S(-J^\mu_1 \tan\theta + J^\mu_2 \cot\theta)$

Quarks' $SU(3)_1 \times SU(3)_2$ charges impact phenomenology

Excited quark:

Baur, Spira, Zerwas: PRD 42 (1990) 815

$$\mathcal{L}_{int} = \frac{1}{2\Lambda}\bar{q}^*_R \sigma^{\mu\nu}\left[g_S f_S \frac{\lambda^a}{2} G^a_{\mu\nu} + g f \frac{\tau}{2}\cdot \mathbf{W}_{\mu\nu} + g' f' \frac{Y}{2} B_{\mu\nu}\right] q_L + \text{H.c.}$$

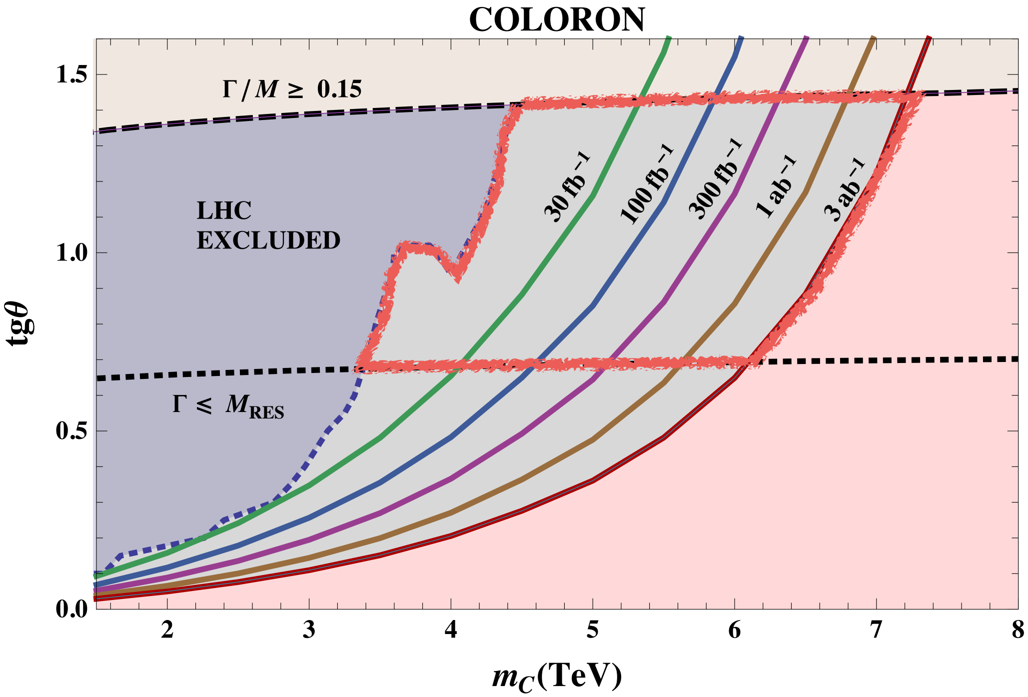
$$\Gamma(q^* \to qg) = \frac{1}{3}\alpha_S f_S^2 \frac{m^3_{q*}}{\Lambda^2}$$

Colored scalar:

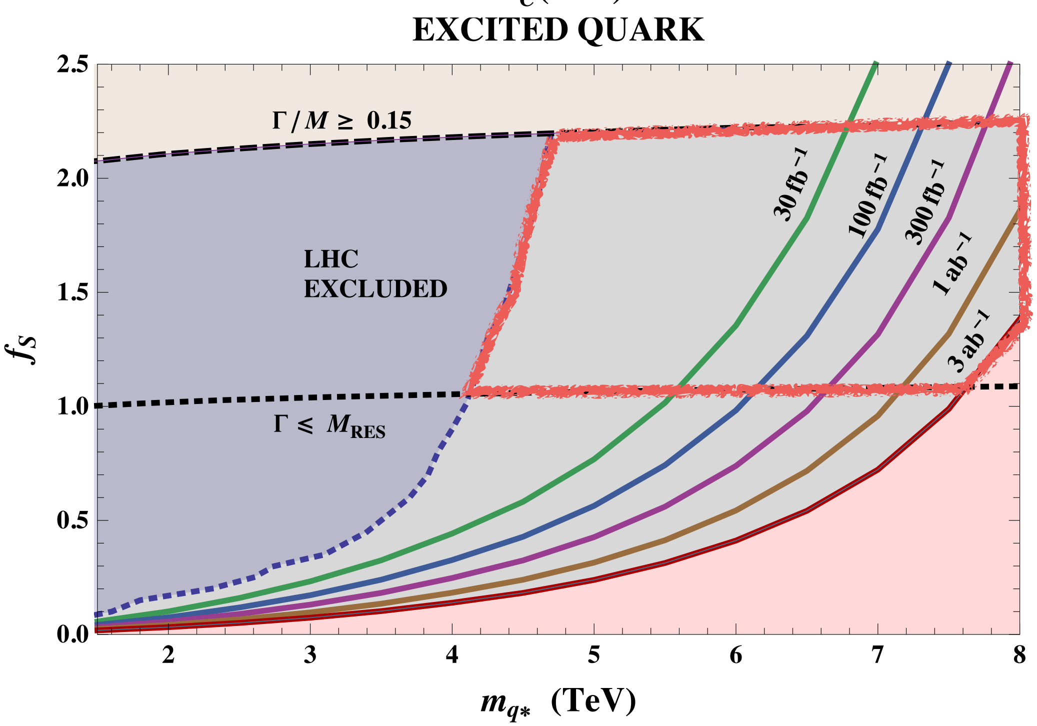
Han, Lewis, Liu arXiv:1010.4309

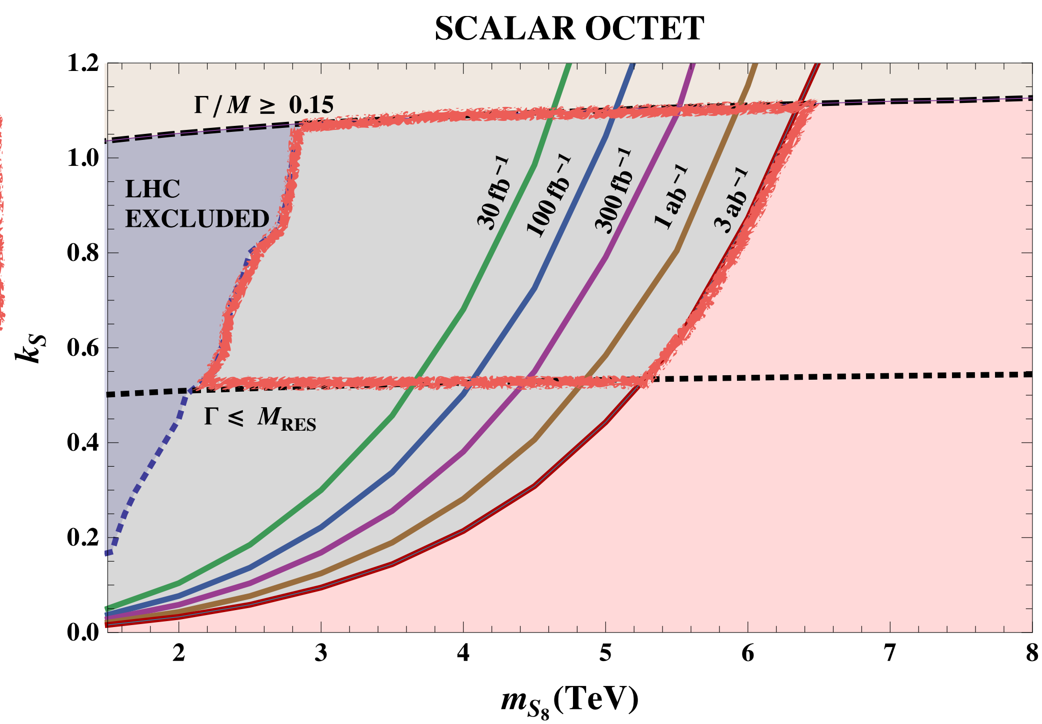
$$\mathcal{L}_{S_8} = g_S d^{ABC} \frac{k_S}{\Lambda_S} S_8^A G^B_{\mu\nu} G^{C,\mu\nu} \qquad \Gamma(S_8) = \frac{5}{3}\alpha_S \frac{k_S^2}{\Lambda_S^2} m^3_{S_8}$$

Vector, Fermion, Scalar



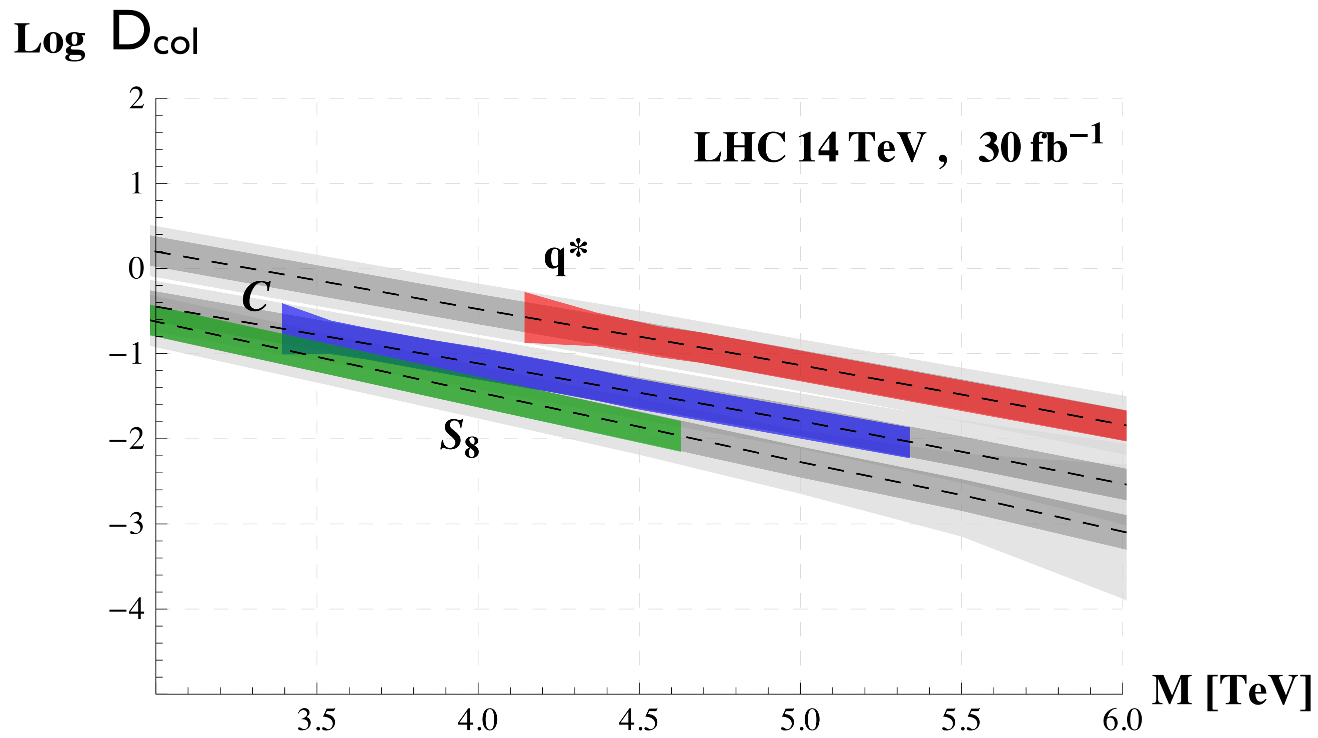
LHC-14 can both *discover* flavor-universal colorons (C), excited quarks (q*), and color-octet scalars (S_8) and also **measure D_{col}**

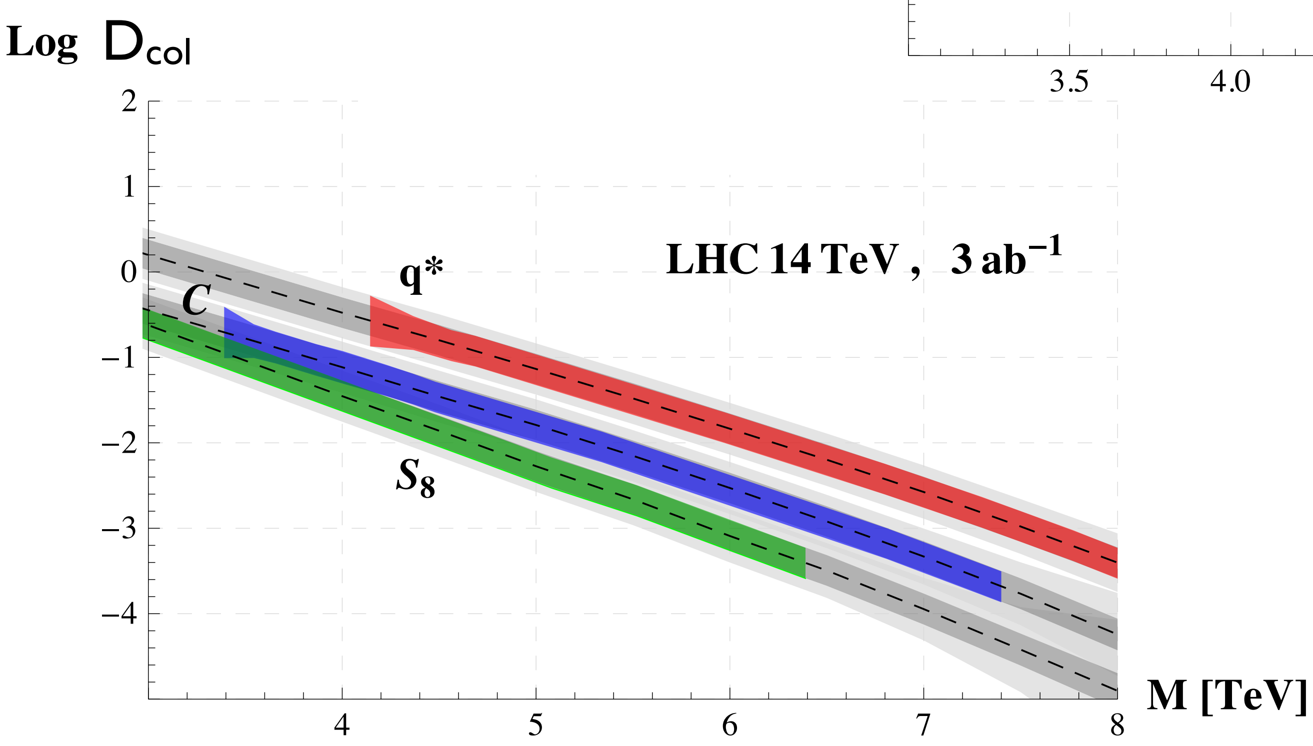




Distinguishing C, q*, S_8

D_{col} can reveal the nature of a colored dijet resonance





Conclusions

Conclusions

When LHC reveals a new BSM resonance decaying to dijets, how will we determine what has been discovered?

$$D_{\rm col} \equiv \frac{M^3}{\Gamma}\sigma_{jj}$$

This talk: Color Discriminant Variable [D_{col}]

- distinguishes coloron from Z' in flavor-universal models
- can also separate scalar, fermion, vector resonances discovered in dijet decays
