SIX LOOP BETA FUNCTION IN φ^4*MODEL*

Thursday 23rd July, 2015

M. Kompaniets
E. Panzer

OVERVIEW

1. Status of the multiloop calculations in φ^4 model
2. Two-point function
3. Four-point function

3.1 IBP, R^*

3.2 Calculating graphs with subdivergences using HyperInt

3.3 Preliminary results

4. Predictions for 6 loop term based on Kazakov, Tarasov, Shirkov (1979) paper
5. Borel resummation
6. Summary

STATUS OF THE MULTILOOP CALCULATIONS IN φ^4 MODEL

STATUS OF THE MULTILOOP CALCULATIONS IN φ^4 MODEL

$$S(\varphi) = -\int d\mathbf{x}\left(\frac{1}{2}\tau\varphi(\mathbf{x})^2 + \frac{1}{2}(\vec{\nabla}\varphi(\mathbf{x}))^2 + \frac{1}{24}g(\varphi(\mathbf{x})^2)^2\right)$$

- critical exponents at 4-loop level:
  - **E. Brezin, J.C. LeGuillou and J. Zinn-Justin**, *Phys. Rev.*, D9 (1974) 1121.
  - **D.I. Kazakov, O.V. Tarasov and A.A. Vladimirov**, *Zh. Eksp. Teor. Fiz.*, 77 (1979) 1035.

[1] no subdivergences

STATUS OF THE MULTILOOP CALCULATIONS IN φ^4 MODEL

$$S(\varphi) = -\int d\mathbf{x} \left(\frac{1}{2}\tau\varphi(\mathbf{x})^2 + \frac{1}{2}(\vec{\nabla}\varphi(\mathbf{x}))^2 + \frac{1}{24}g(\varphi(\mathbf{x})^2)^2 \right)$$

- critical exponents at 4-loop level:

TWO-POINT FUNCTION

TWO-POINT FUNCTION

in collaboration with D.V. Batkovich and K.G. Chetyrkin

Number of graphs in Γ_2
(two-point 1PI Green function)

# of loops	1	2	3	4	5	**6**
# of graphs	0	1	1	4	11	**50**

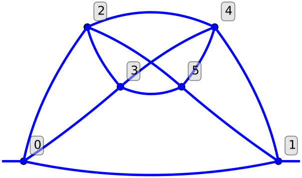
Theorem
(L)-loop counterterms can be calculated using R^* operation and (L-1)-loop IBP reduction

With 4-loop IBP reduction we can calculate only 48 out of 50 6-loop graphs

Graph equals to $G(1,5\varepsilon)F(\varepsilon)$, where $G(1,5\varepsilon) = -5/12 + \mathcal{O}(\varepsilon)$ and $F(\varepsilon)$ is pole part of 5-loop subgraph.

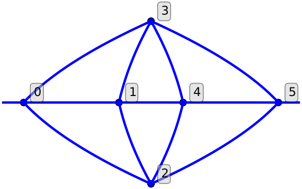
It is not possible to calculate $F(\varepsilon)$ using 4-loop IBP

Pole part of $F(\varepsilon)$ can be reconstructed from the 5-loop counterterm.



No IRR for this graph which allows to use 4-loop IBP

Calculated using transition to dual graph



TWO-POINT FUNCTION, ANOMALOUS DIMENSION OF THE FIELD

$$
\begin{aligned}
\gamma_\varphi(u) =& \frac{u^2(n+2)}{36} - \Big[8+n\Big]\frac{u^3(n+2)}{432} + \Big[500+90\,n-5\,n^2\Big]\frac{u^4(n+2)}{5184} + \\
&+\Big[-77056+8832\,\zeta_3-25344\,\zeta_4+(-22752+3072\,\zeta_3-5760\,\zeta_4)\;n+ \\
&+(-296-288\,\zeta_3)\;n^2+(-39+48\,\zeta_3)\;n^3\Big]\frac{u^5(n+2)}{186624} + \\
&+\Big[\mathbf{1410544+297472\,\zeta_3+619776\,\zeta_4-833536\,\zeta_5-95232\,\zeta_3^2+1190400\,\zeta_6}+ \\
&+\Big(\mathbf{549104+69888\,\zeta_3+215808\,\zeta_4-293632\,\zeta_5-28160\,\zeta_3^2+352000\,\zeta_6}\Big)\;\mathbf{n}+ \\
&+\Big(\mathbf{30184+14976\,\zeta_3+15744\,\zeta_4-23680\,\zeta_5-1024\,\zeta_3^2+12800\,\zeta_6}\Big)\;\mathbf{n^2}+ \\
&+(\mathbf{-794+96\,\zeta_4})\;\mathbf{n^3}+(\mathbf{-29-16\,\zeta_3+48\,\zeta_4})\;\mathbf{n^4}\Big]\frac{\mathbf{u^6(n+2)}}{\mathbf{746496}} + \mathcal{O}(u^7)
\end{aligned}
$$

TWO-POINT FUNCTION, ANOMALOUS DIMENSION OF THE FIELD

$$
\begin{aligned}
\gamma_\varphi(u) =& \frac{u^2(n+2)}{36} - \left[8+n\right]\frac{u^3(n+2)}{432} + \left[500+90\,n-5\,n^2\right]\frac{u^4(n+2)}{5184} + \\
&+\Big[-77056 + 8832\,\zeta_3 - 25344\,\zeta_4 + (-22752 + 3072\,\zeta_3 - 5760\,\zeta_4)\;n + \\

&+\Big(\mathbf{549104 + 69888\,\zeta_3 + 215808\,\zeta_4 - 293632\,\zeta_5 - 28160\,\zeta_3^2 + 352000\,\zeta_6}\Big)\;\mathbf{n} + \\
&+\Big(\mathbf{30184 + 14976\,\zeta_3 + 15744\,\zeta_4 - 23680\,\zeta_5 - 1024\,\zeta_3^2 + 12800\,\zeta_6}\Big)\;\mathbf{n^2} + \\
&+(\mathbf{-794 + 96\,\zeta_4})\;\mathbf{n^3} + (\mathbf{-29 - 16\,\zeta_3 + 48\,\zeta_4})\;\mathbf{n^4}\Big]\frac{\mathbf{u^6(n+2)}}{\mathbf{746496}} + \mathcal{O}(u^7)
\end{aligned}
$$

No ζ_7 here

TWO-POINT FUNCTION, CRITICAL EXPONENT η

$N = 1$, $D = 4 - 2\varepsilon$

$$\eta(\varepsilon) = 2\gamma_\varphi(u_*) = \frac{2}{27}\varepsilon^2 + \frac{109}{729}\varepsilon^3 + \left(\frac{7217}{39366} - \frac{64}{243}\zeta_3\right)\varepsilon^4 +$$
$$+\left(\frac{321511}{2125764} - \frac{32}{81}\zeta_4 - \frac{1316}{2187}\zeta_3 + \frac{1280}{729}\zeta_5\right)\varepsilon^5 +$$
$$+\left(\mathbf{\frac{3421613}{38263752}} - \mathbf{\frac{181462}{177147}}\zeta_3 - \mathbf{\frac{658}{729}}\zeta_4 + \mathbf{\frac{73232}{19683}}\zeta_5 + \mathbf{\frac{2432}{2187}}\zeta_3^{\mathbf{2}} + \mathbf{\frac{3200}{729}}\zeta_6 - \mathbf{\frac{3136}{243}}\zeta_7\right)\varepsilon^{\mathbf{6}} + \mathcal{O}(\varepsilon^7$$
$$= 0.074074\,\varepsilon^2 + 0.149520\,\varepsilon^3 - 0.133260\,\varepsilon^4 + 0.821006\,\varepsilon^5 - \mathbf{5.201449}\,\varepsilon^6 + \mathcal{O}(\varepsilon^7)$$

ζ_7 originates from u_* value

$1/N$-expansion up to $1/N^3$ using conformal bootstap technique

A.N. Vasiliev, Yu.M. Pis'mak, J. Honkonen, *Theor. Math. Phys.*, 50,N 2, p127 (1982) [2]:

$$\eta_N = \frac{\eta_1(\varepsilon)}{N} + \frac{\eta_2(\varepsilon)}{N^2} + \frac{\eta_3(\varepsilon)}{N^3} + \mathcal{O}\left(\frac{1}{N^4}\right) \quad \text{for any } \varepsilon,$$

We know η_N up to $1/N^3$ for any ε and we know η_ε up to ε^6 for any N.

$$\boxed{\eta_N \text{ expansion by } \varepsilon = \eta_\varepsilon \text{ expansion by } 1/N}$$

[2] This paper contains missprint in the second term of the r.h.s of eq. (22): the denominator must be $3(2-\mu)^3$ (for details see **Vasilev A. N.**, Quantum Field Renormalization Group in Critical Behavior Theory and Stochastic Dynamics, 2004)

$1/N$-expansion up to $1/N^3$ using conformal bootstap technique

A.N. Vasiliev, Yu.M. Pis'mak, J. Honkonen, *Theor. Math. Phys.*, 50,N 2, p127 (1982) [2]:

$$\eta_N = \frac{\eta_1(\varepsilon)}{N} + \frac{\eta_2(\varepsilon)}{N^2} + \frac{\eta_3(\varepsilon)}{N^3} + \mathcal{O}\left(\frac{1}{N^4}\right) \quad \text{for any } \varepsilon,$$

We know η_N up to $1/N^3$ for any ε and we know η_ε up to ε^6 for any N.

η_N expansion by ε = η_ε expansion by $1/N$

Three independent relations for 6 loop diagrams.

All of 6-loops self-energy diagrams give contribution to η_3.

[2] This paper contains missprint in the second term of the r.h.s of eq. (22): the denominator must be $3(2-\mu)^3$ (for details see **Vasilev A. N.**, Quantum Field Renormalization Group in Critical Behavior Theory and Stochastic Dynamics, 2004)

$1/N$-expansion up to $1/N^3$ using conformal bootstap technique

A.N. Vasiliev, Yu.M. Pis'mak, J. Honkonen, *Theor. Math. Phys.*, 50,N 2, p127 (1982) [2]:

$$\eta_N = \frac{\eta_1(\varepsilon)}{N} + \frac{\eta_2(\varepsilon)}{N^2} + \frac{\eta_3(\varepsilon)}{N^3} + \mathcal{O}\left(\frac{1}{N^4}\right) \quad \text{for any } \varepsilon,$$

We know η_N up to $1/N^3$ for any ε and we know η_ε up to ε^6 for any N.

$$\boxed{\eta_N \text{ expansion by } \varepsilon = \eta_\varepsilon \text{ expansion by } 1/N}$$

Three independent relations for 6 loop diagrams.

All of 6-loops self-energy diagrams give contribution to η_3.

We have indeed found FULL agreement to this 32 years old prediction!

[2] This paper contains missprint in the second term of the r.h.s of eq. (22): the denominator must be $3(2-\mu)^3$ (for details see **Vasilev A. N.**, Quantum Field Renormalization Group in Critical Behavior Theory and Stochastic Dynamics, 2004)

FOUR-POINT FUNCTION

FOUR-POINT FUNCTION

Number of graphs in Γ_4
(four-point 1PI Green function)

# of loops	1	2	3	4	5	**6**
# of graphs	1	2	8	26	124	**627**

- ***factorized*** – can be represented as product of two graphs $\gamma = \gamma_1 \cdot \gamma_2$, $KR'(\gamma) = -KR'(\gamma_1) \cdot KR'(\gamma_2)$
- ***4-loop reducible*** – graphs which contains 4-loop(or less) p-integral as subgraph and the rest part can be integrated using *G*-functions
- ***primitive*** – graphs with no subdivergences [3]
- ***4-loop irreducible*** – graphs cannot be calculated using 4-loop IBP and R^* [4]

factorized	124
4-loop reducible	481
primitive	10
4-loop irreducible	12

[3] **O. Schnetz**, *Commun. Number Theory Phys.* 4 (2010), no. 1 1–47, arXiv:0801.2856
[4] **E. Panzer**, *Comp. Phys. Comm.*, 188 (2015), pp. 148-166, arXiv:1403.3385

4-LOOP REDUCIBLE GRAPHS, IBP, R^*

- Infrared rearrangement(IRR) and R^*-operation implemented as *Python* library [5] on top of GraphState/Graphine library

- IBP reduction also implemented on *Python* with *mongodb* as cache. Reduction rules are generated by LiteRed[6]

- Master integral values are taken from Baikov/Chetyrkin paper[7] and Lee/Smirnov/Smirnov paper[8]

  Surprisingly that for 6-loop Γ_2 graphs it is enough master integral values from Baikov/Chetyrkin paper, but for 6-loop Γ_4 graphs one more term from Lee/Smirnov/Smirnov paper is required.

- Counterterms for graphs calculated with all possible rearrangements of external momenta (extensive consistency check for IBP and R^*)

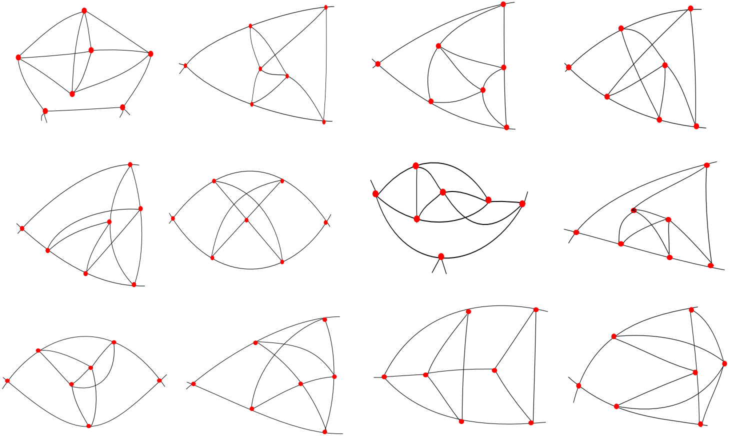
4-LOOP IRREDUCIBLE GRAPHS



All graphs contain subdivergences (up to 4 subgraphs)

HYPERINT (E.PANZER)

Many Feynman integrals are expressible via multiple polylograithms (MPL)

$$\mathtt{Li}_{n_1,\ldots,n_d}(z_1,\ldots,z_d) = \sum_{0<k_1<\cdots<k_d} \frac{z_1^{k_1}\cdots z_d^{k_d}}{k_1^{n_1}\cdots k_d^{n_d}}$$

and there special values, like multiple zeta values (MZV) $\zeta_{n_1,\ldots,n_d} = \mathtt{Li}_{n_1,\ldots,n_d}(1,\ldots,1)$

MPL can be rewritten in terms of hyperlogarithms

$$G(\sigma_1,\ldots,\sigma_w;z) = \int_0^z \frac{dz_1}{z_1-\sigma_1}\int_0^{z_1}\frac{dz_2}{z_2-\sigma_2}\cdots\int_0^{z_{w-1}}\frac{dz_w}{z_w-\sigma_w}$$

Main idea: consider graph in alpha-representation and integrate out one variable after other

$$f_n = \int_0^\infty f_{n-1}d\alpha_n = \int_{(0,\infty)^n} f_0 d\alpha_1\cdots d\alpha_n, \qquad f_0 = \frac{\psi^{sdd-D/2}}{\phi^{sdd}}\prod_e \alpha_e^{a_e-1}, sdd = \sum_e a_e - DL/2$$

If on each step of integration function f_{n-1} can be represented in terms of hyperlogarithms in α_n with rational prefactors

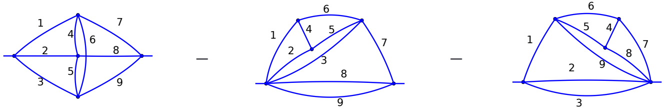
$$f_{n-1} = \sum_{\vec{\sigma},\tau,k} \frac{G(\vec{\sigma};\alpha_n)}{(\alpha_n-\tau)^k}\lambda_{\sigma,\tau,k}, \quad \texttt{with } \sigma \texttt{ and } \tau \texttt{ independent of } \alpha_n$$

graph is called *linearly reducible* and can be integrated analytically using HyperInt.

for details see **E.Panzer**, *Comp. Phys. Comm.*, 188 (2015), pp. 148-166,
E.Panzer, Feynman integrals and hyperlogarithms (PhD Thesis) arXiv:1506.07243 and references therein

HYPERINT (E.PANZER), GRAPHS WITH SUBDIVERGENCES

- algorithm does not limited by some particular loop number
- some limitations on the graph combinatorial type (graph must be linearly reducible)
  At this moment all graphs we need to calculate are linearly reducible
- we need to pass to HyperInt integrand without subdivergences
- we need to find some combination of graphs which are free from subdivergences (on the integrand level), this combination except the target graph must contain graphs which are "easier" to calculate [9]



- For automated calculations we need automation for subtraction terms generation.
  (current implementation work only for graphs with 2-3 subgraphs)

PREDICTIONS FOR 6 LOOP TERM BASED ON KAZAKOV, TARASOV, SHIRKOV (1979) PAPER

PREDICTIONS FOR 6 LOOP TERM

$$\overline{\beta}(u) = \frac{\beta(u) + 2\varepsilon u}{2} = \frac{3}{2}u^2 - \frac{17}{6}u^3 + 16.27u^4 - 135.80u^5 + 1424.28u^6 - 17548.38u^7 + \mathcal{O}(u^8)$$

Borel transform:

$$\beta^B(u) = \int_0^\infty \frac{dx}{u} e^{-x/u} \left(x \frac{\partial}{\partial x}\right)^b B(x), \quad B_n = \frac{\overline{\beta}_n}{n! n^b}$$

with consequent conformal mapping

$$B(x) = \sum_{n=2}^{N} x^n B_n \to B(x) = \left(\frac{x}{\omega}\right)^\nu \left(a_0 + a_1\omega + a_2\omega^2 + \cdots + a_N\omega^N\right), \quad \omega(x) = \frac{\sqrt{1+x} - 1}{\sqrt{1+x} + 1}$$

coeffs a_i are fixed from the requirement to reproduce coefficients B_n known from loop expansion, ν defines asymptotic of $\beta(g)$ when $g \to \infty$, if asymptotic is not known ν is defined from minimization of $\eta_{N+1} = 1 - \beta^B_{N+1}/\beta^B_N$.

$$1.7 < \nu < 2.2$$

Expanding $B(x)$ up to x^{N+1} one can get predicition for $N + 1$ coefficient for beta function

SUMMARY

SUMMARY

- 6 loop calculation for φ^4 model are almost complete, beta function contains multiple zeta value $\zeta_{3,5}$
- Automation for calculation of the graphs with subdivergences using HyperInt
- Additional crosschecks for beta-function using HyperInt
- Predictions of Kazakov/Tarasov/Shirkov for 6 loop terms gives only 2% error!
- Resumed critical exponents for 3D Ising model are in good agreement with both simulation and experimental data
- Resumed critical exponents for 2D Ising model are still far from exact solution
