HIE-ISOLDE Project Status Report

> TSR@ISOLDE Workshop April 27th 2015

> > Y. Kadi

### CM1 assembly status

Next:

- Pressure test
- Transport to ISOLDE Saturday May 2<sup>nd</sup> !

#### Baseline planning adopted in April 2014, with status

#### **Components:**

- Cavities assembled so far 10 from RI, 9 sputtered (6/10 RI + 2 CERN) 5 used in CM1;
  - QS2 was re-coated and tested (considerable improvement) => plan to have next batch of 5 ready by June

### 2015.

- Solenoid#2 new coil (#6) impregnated wk6; passed training: Inom in 4 quenches => delivery planned for wk12 => wk ??.
- Vacuum vessel metrology data controled => OK
- He vessel => OK
- Thermal shield all Ni plated panels arrived at CERN; MME repaired the damaged pipes (bent by Corima); pressure test => OK.

### Planning:

- Announced assembly time for CM2 21 wks.
- Assembly start ca. wk 14 (end March) => wk 19 end April
- Assembly finish ca. wk 39-40 (end September)
- Cold test in SM18 ca. wks 41-48 (until end November)
- Installation in SC Linac SD 2015/2016, then HW commissioning
- Beam to ISOLDE start ca. April 2016 (?), beam commissioning 5-7 weeks, physics at 5.5. MeV/c could start ca. mid/end May 2016

#### Manpower:

- TE-MSC confirms deployment of same staff for CM2 as for CM1;
- As of end March gradual handing-over of the activities to BE-RF, while responsibility for assembly remains with TE-MSC.
- To make up for that BE-RF intends to put additional staff (clean room technicians and RF engineer)

### **HIE Installation Progress**

Cryo System: Compressors commissioning done. Liquid He made.

# **Cold Box building 199**

Cryo: Last control cabling ongoing. Cold distribution line pressure tests done. Coldbox getting ready for commissioning phase. RF: Amplifier HW tests ongoing. Slow control installed. LLRF ready. Solenoid: rack ready for EPC. AC to be connected. ODH and fire detection operational.

# **Cryo Distribution Line**

Cryo Cold Line & Jumper Boxes instrumentation installation finishing. Pressure tests done on Cold Line. Tunnel roof cleared by 28 April for the arrival of CM1. Cryo Module 1 installation Saturday 2nd May. Transport & handling test done. Scenario: Physics at ~4MeV/u with 1 CM as of October (November) 2015

### **HEBT** installation

# HW commissioning of XT00

- Work on procedures: February 2015 (EC closed 3 March)
- Safety inspections: 2 March, 6 March
- 2 March-12 March, 7 commissioning steps on 14 circuits

### In summary

- HW Commissioning of the HEBT magnet circuits
  - ✓ XT00 done
  - ✓ XT01 done
  - XT02 planned for week 25
- Commissioning of Cryogenics (see Nicolas's talk)
  - ✓ Warm compressors done
  - Cold box: ongoing
  - Distribution lines, Dewar and Jumper boxes: ongoing
- Survey and alignment
  - In two phases (rough and smooth)
  - XT00, tunnel part, rough alignment done in week 13
  - Need to do XT00-XT01 early enough for REX start-up with beam
- Installation CM1 in the Linac: Saturday 2 May (end of week 18)
- CM cold tests May-July 2015
- Dry runs of individual systems whenever possible, controls debugging (BE/OP)
- Machine Checkout at the end of July
- Beam Commissioning as from week 35 (end of August), 7 weeks

### Phase II (CM3 + CM4)

### **HIE-ISOLDE** Roadmap

Green light to continue procurement for HIE-ISOLDE phase II still pending (under preparation)

Existing REX-structures:

RFQ, IHS: 20-gap IH-structure, 7GX: 7-gap split-ring cavities, 9GP: 9-gap IH-structure

### Phase 2 draft schedule

- Phase 2 duration = 24 months (already started)
- □ 2017 physics run could typically start on wk23/2017 (2<sup>nd</sup> week June)

### **OPTIONS:**

a) Cavity production for CM3 and CM4 to perform w/o interruption if substrates available wk32 (end July 2015)

=> it gives 17wks margin for cavity availability

b) Anticipated CM3 assembly if first components available earlier (gain of 7wks)
=> it may allow physics start on wk16/2017 (mid April)

**3rd Beam Line** 

### Layout XT03 + potential U-turn

Two proposals for HIE-ISOLDE beam line extensions have been suggested for the future (i.e. sometime after the initial installation of XT01 and XT02).

- XT03: to accommodate a small travelling detector 1 x 1 m (included in Cost-to-Completion of Phase-3). This would involve the addition of 2 dipoles, 8 quadrupoles, 4 long DB and 3 steerer magnets, plus associated vacuum chambers. The rest of the infrastructure has already been installed (Phase1).
- 2. U-turn: to accommodate MINIBALL + Large Angle Spectrometer setup (enables in parallel to connect to the TSR) or a HELIOS type detector as pursued by the UK ISOL-SRS collaboration which was recently awarded a total budget of £4.8M (2015-2019) by the STFC (UK), for exploitation of the TSR. This would involve the addition of 4 dipoles, 11 quadrupoles, 6 long DB and 4 steerer magnets, plus associated vacuum chambers, cabling, power convertors, interlocks, cooling and supports. This is not in the present CtC.

#### **Components required**

Both proposals will be technically feasible, from the point of view of optics and performance, with the addition of standard periods of 2.62m and standard bend configurations into the lattice.

Item	Number	Spares	Unit Cost kCHF	Total kCHF*			
				Infrastructure	Machine		
Magnet MD	2	1 1	110		550		
Magnet MQ	11	. 1	22		264

Convertor MD	2	2	65	130			
Convertor MQ	7	7	15	105			
Convertor ST	3	3	12	36			
Long Diagnostic Box	e	5 1	32		192		
Vacuum pump + gauges	e	5	11		66		
New vacuum sector	2	2	12		24		
Vacuum chamber MD	2	2	25		50		
Vacuum chamber MQ	7	7	5		35		
Vacuum chambers SSS/triplet	4	ļ	5		20		
Interlocking MD/MQ/ST (incl. cabling)	20	)	2	40			
MD jacks	6	5	4.5		27		
Supports type Doublet/Triplet	3	3	4		12		
XYZ stages	12	2	2		24		
Cabling MD/MQ/ST magnets + racks	10	)	5	25	25		
Cabling DB + rack	2	ŀ	5	10	10		
Cabling vacuum	4	Ļ	5	10	10		
Cooling MD/MQ/ST	14	ļ	2.5	35			
Installation and survey (man-months)	3	3	8	24			
Design layout/integration (man-months)	2	Ļ	8	32			
Beam dynamics (man-months)	2	2	8	16			
Control Software (man-months)	2	2	8	16			
Total				479	1361		

- ✓ It was suggested that the HIE-ISOLDE beam quality could be improved by the insertion of an energy-spread reducing de-buncher in the U-turn in order improve the Q-value resolution of HELIOS (EDMS 1183997). Such a de-buncher is of advantage, but deemed not necessary by the ISOLDE Collaboration;
- Before any implementation can be decided, studies will be needed to define or check:
  - Cooling and Ventilation capacity;
  - Rack space;
  - Cabling layouts;
  - Integration;
  - Interlocking;
  - Vacuum sectorisation;
  - Stray fields;
  - Beam dynamics confirmation.

# Summary

- Phase I shall normally be ready in time (provided no major technical issues turn up – transport incident, major vacuum leak, pollution, RF performance...).
  Present ready-for-installation date of CM1 = wk 18/2015; CM2 = wk 48/2015
- Procurement for phase II (CM 3 + 4) is being launched approved by management mid April 2015.
- Construction for **phase II** (CM 3 + 4) planned for 2016, allowing physics with 4 high-beta CMs as of 2017.
- Budget for **phase II** (CM3 + 4) has been consolidated in MTP2015
  - FSU for cryomodule assembly;
  - cost increase of components;
- To be considered for MTP2015:
  - machine spare parts;
  - consolidation of cryogenic system;
- Maintaining current level of resources + Continued high commitment needed at all levels to make the above plans a reality.
