MC4LHC Workshop, 21 July 2006

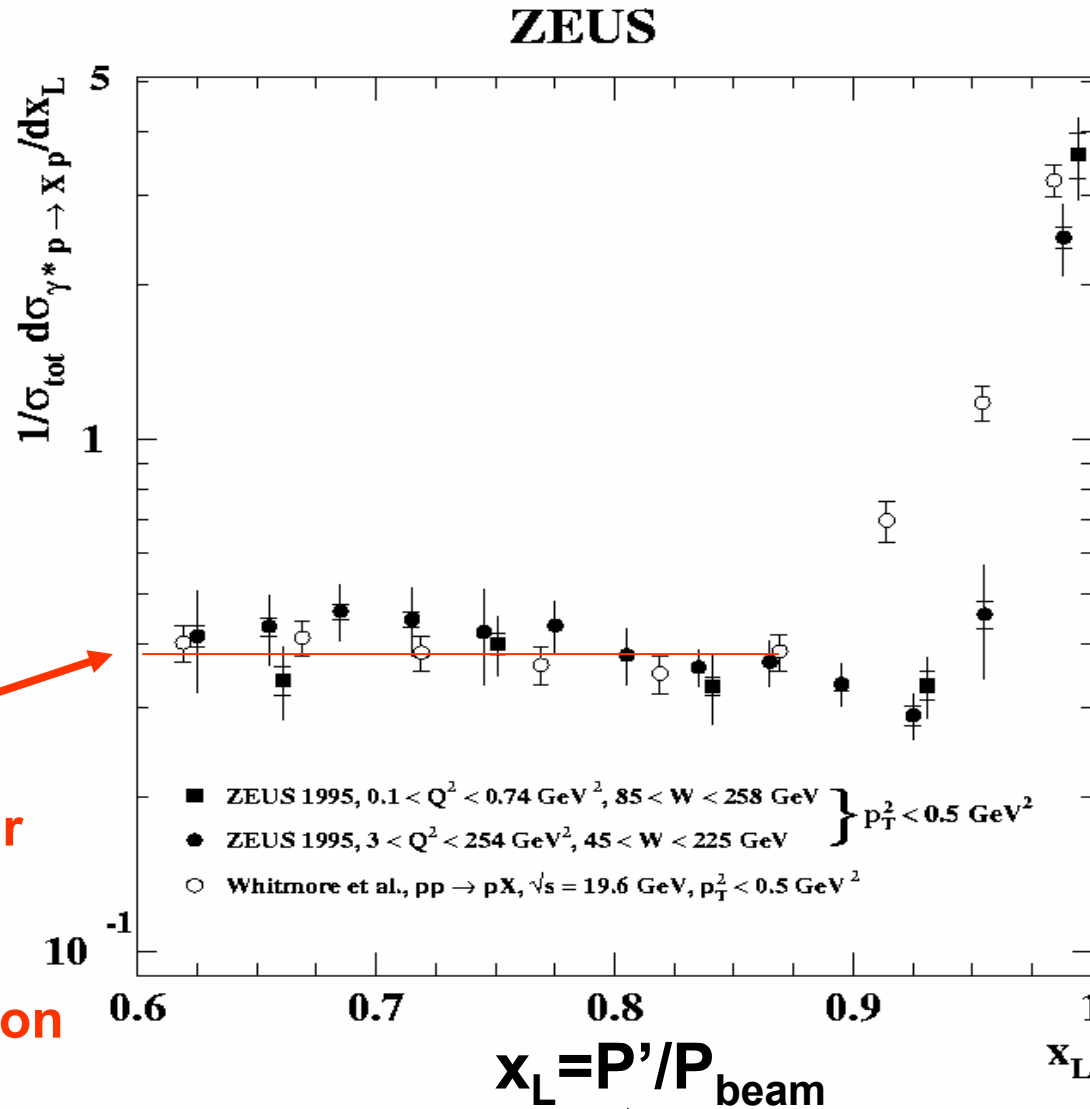

Pile-up

- **Diffractive and elastic processes in the PU critical for forward-physics studies:**
 - they produce forward protons in the same kinematic region as the signal
 - at luminosities with significant PU, fake diffractive events from overlap of diffractive PU events with non-diffractive process observed in the central CMS detector are the most pertinent background source
- **Including elastic and diffractive events, there are on average**
 - 7 PU events @ $2 \times 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$
 - 35 PU events @ $1 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$
- **Compared Pythia (MSEL=2) and Phojet with HERA leading proton spectra**

What do we expect ?

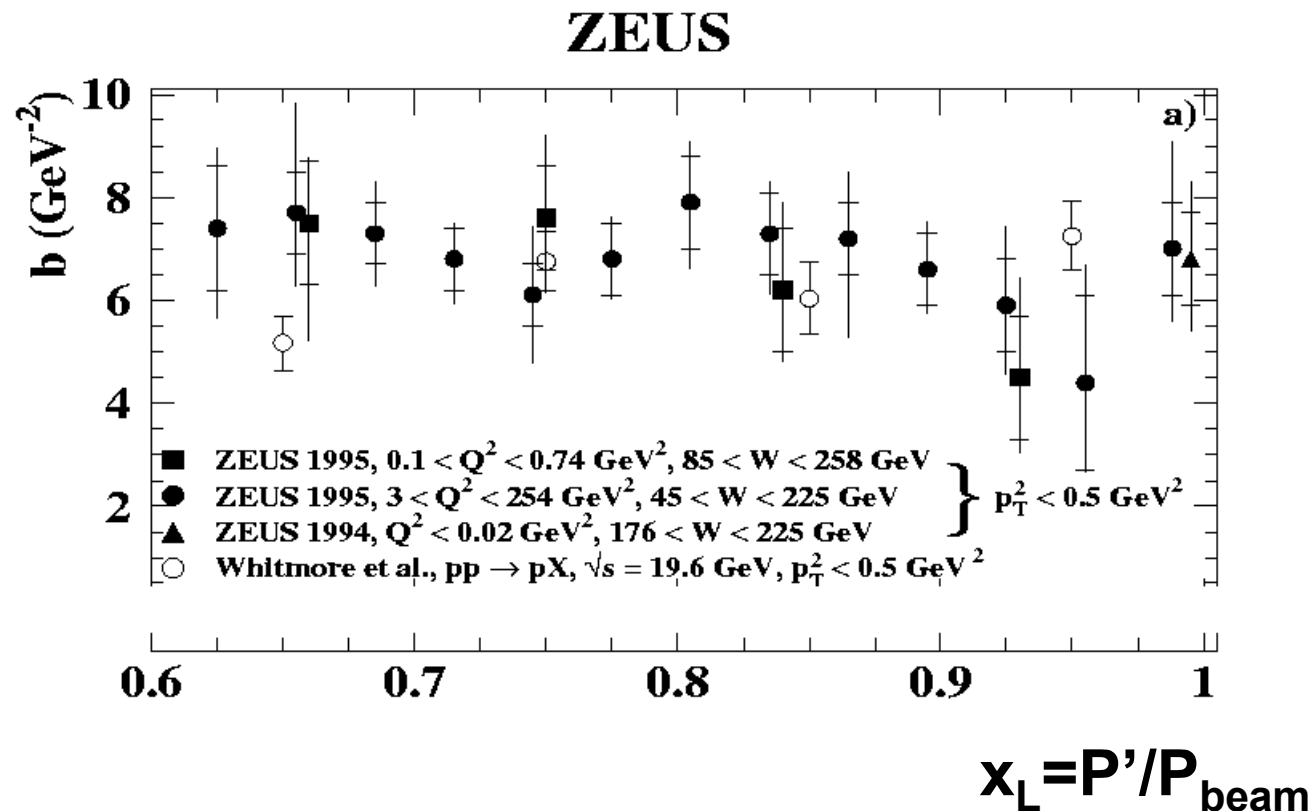

What do we expect ?

Universal number
Same for ep, pp
No surprise:
vertex factorisation

What do we expect ?

- Approximately exponential p_T^2 distributions
- Slope approx 5-7 GeV^{-2}

What we find

Pythia wrong in shape
and normalisation outside
diffractive peak
(approx factor 2-3)

$$x_L = P'/P_{\text{beam}} \frac{p'_z/p_z}{p_z/p_z}$$

Fastest proton in the event

What we find

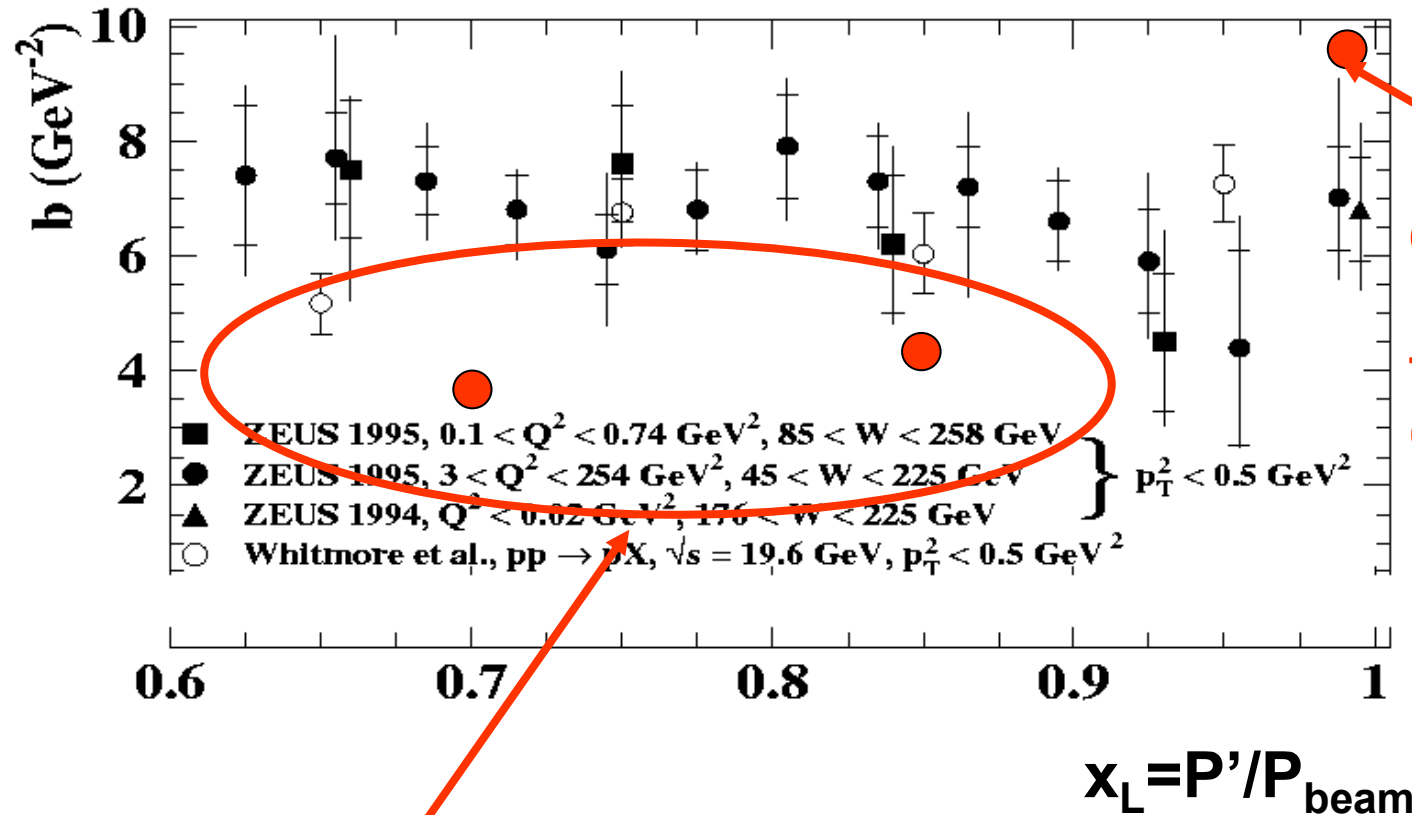

**Pythia approx OK
in diffractive peak
(after removing elastic
component, not there
in HERA data)**

$$x_L = P'/P_{\text{beam}} \quad p'_z/p_z$$

Fastest proton in the event

What we find

ZEUS

Pythia approx
 OK in diffractive
 Peak, after
 taking shrinkage
 $(b = b_0 + 4\alpha' \ln s)$
 into account

Pythia too low outside
 diffractive peak

• b_{elastic} approx 21 GeV^{-2} (as expected)

Phojet a little worse than Pythia...

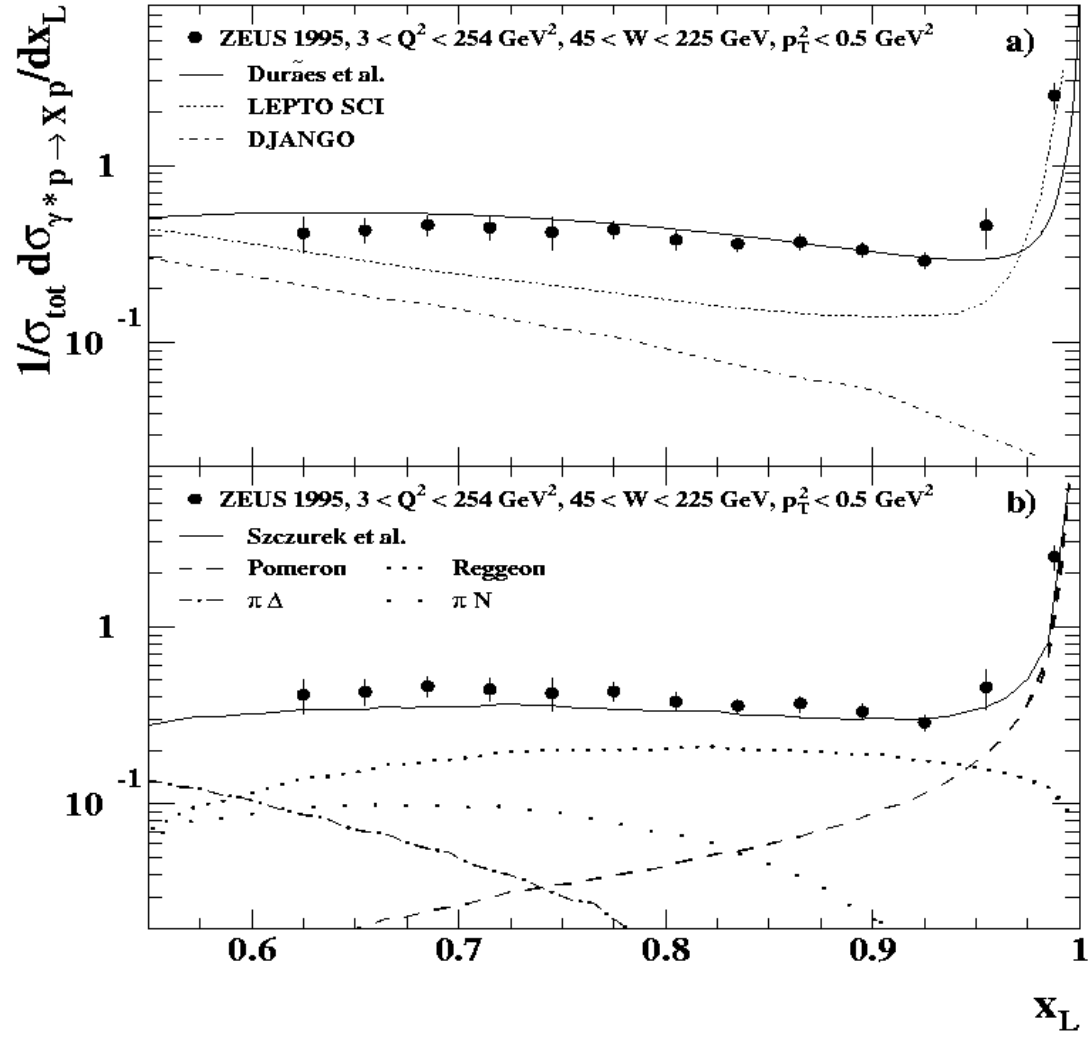

Summary

- A first look at pile-up files with diffraction and elastic scattering – concentrate on momentum spectra of scattered leading proton
- Pythia underestimates (factor 2-3) the rate of leading protons outside the diffractive/elastic peak. Rescaling needed.
- p_T^2 slopes also factor 2 too low outside diffractive/elastic
- Approx OK in diffractive-peak region
- Similar situation for Phojet

*CMS diffractive group is using correction function provided by Marta
Was already used for diffractive trigger rates included in CMS/PTDR2
→ Correction function should be made available in
official CMS MC software so that everybody can use it
Where ?*

ACCEPTANCE

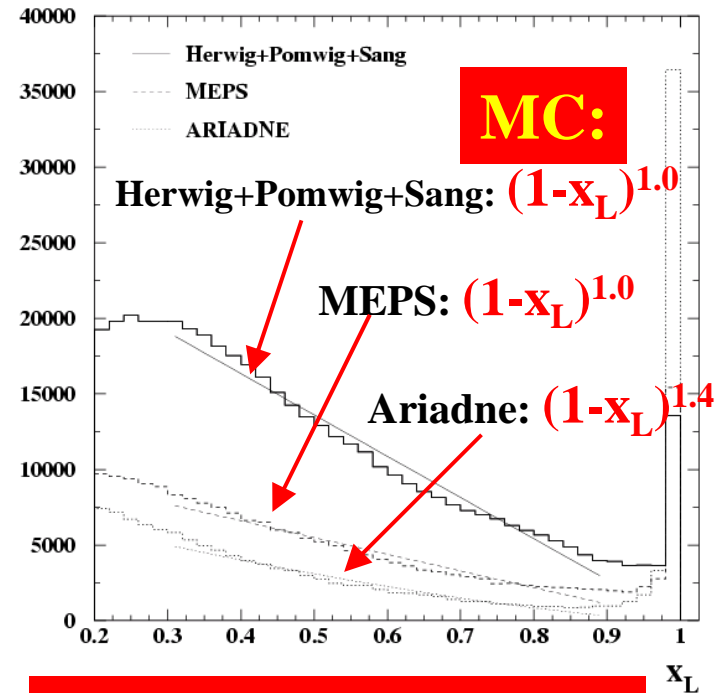

ZEUS

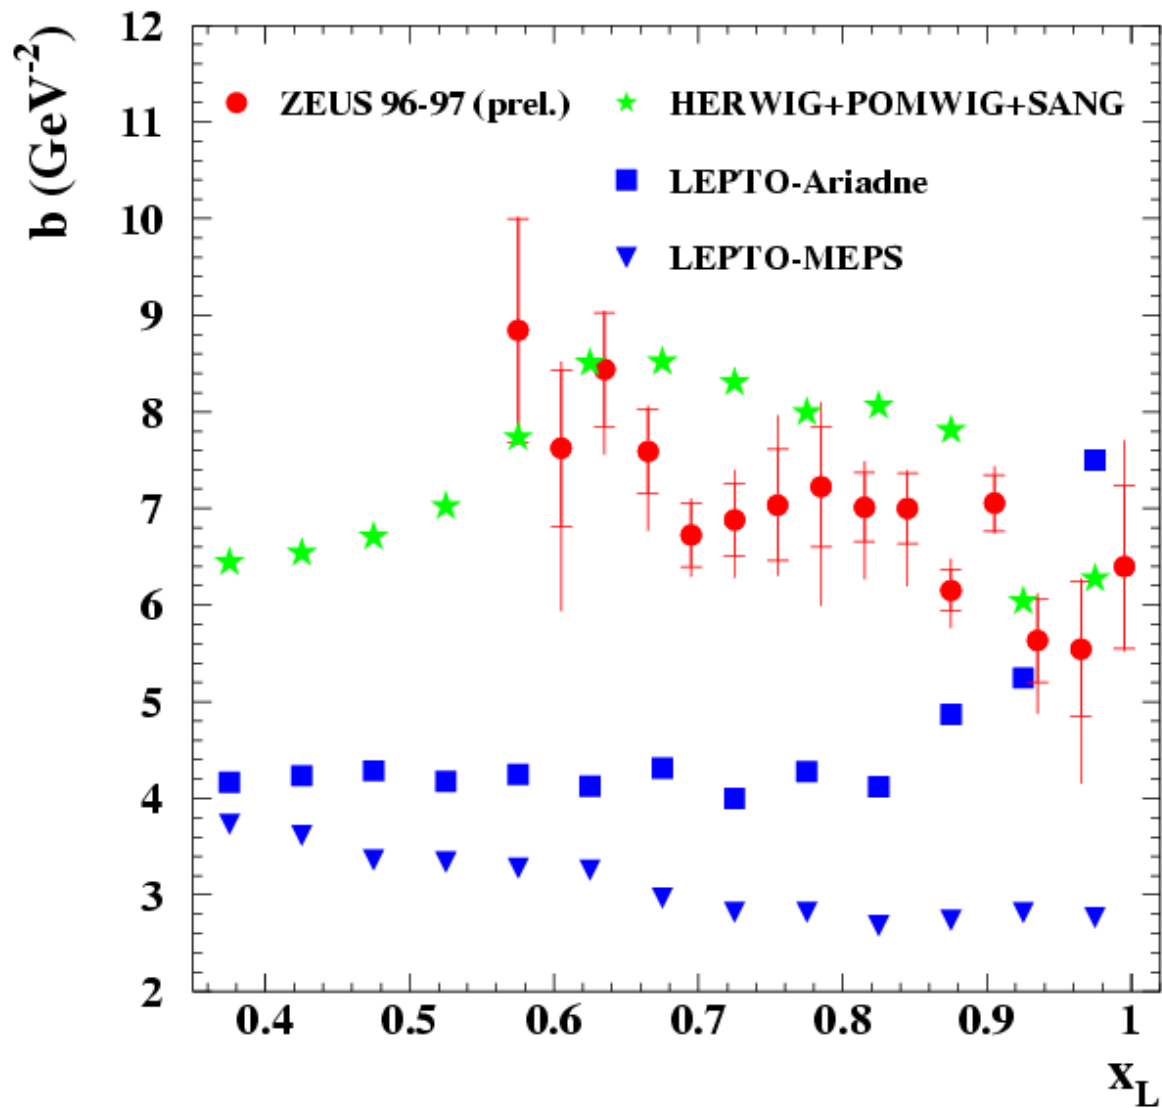

x_L distribution: DATA vs. MC

My own fits below the diffractive peak:

⇒ quite different!

A vs. MC

Fit $d\sigma/dp_T^2$ to $e^{-bp_T^2}$
 in the range
 $p_T^2 < 0.5 \text{ GeV}^2$
