

PDF Constraints from W & Z Bosons at the Tevatron

PHOTON 2007
Paris : July 11 2007

Mark Lancaster
University College London

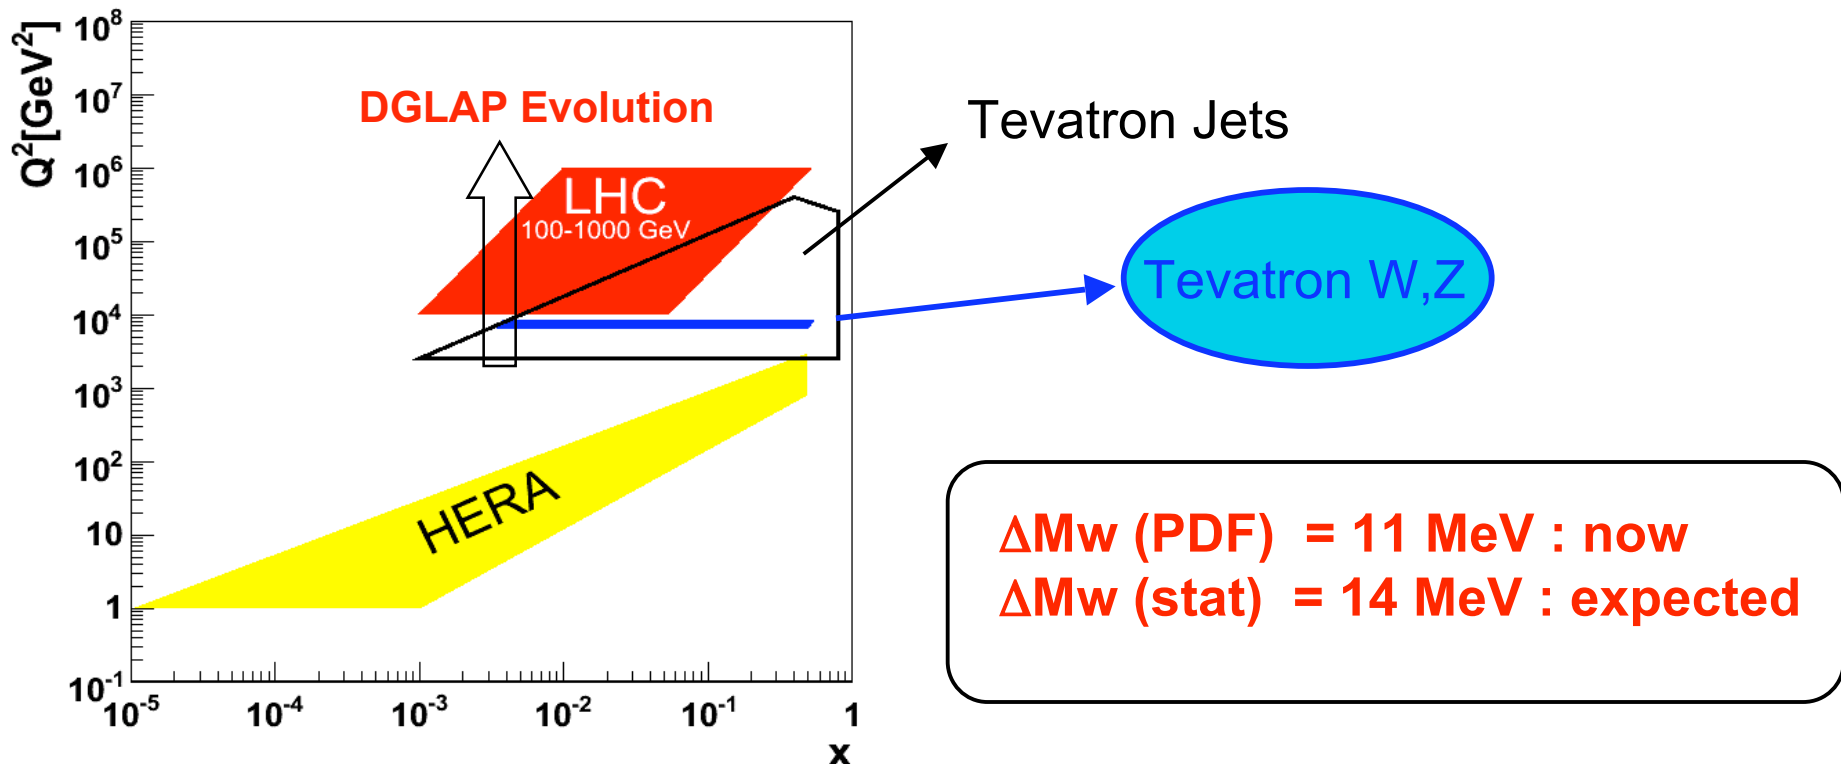

Motivation

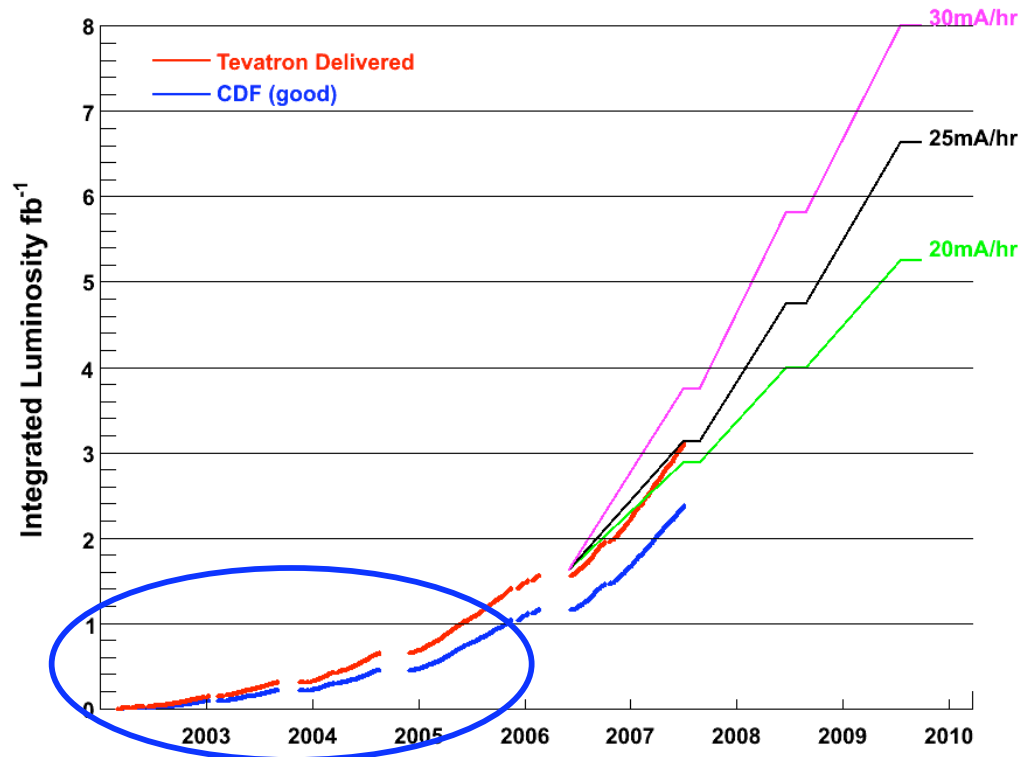

- Need accurate PDFs over largest possible x - Q^2 range to maximise physics returns
 - for Tevatron data e.g. M_W , σ_{tt}
 - and searches at the energy frontier, particularly LHC

The Measurements

Z rapidity
Z+b cross-section

Forward W/Central W
W charge asymmetry

These results : based on $0.1 - 1.0 \text{ fb}^{-1}$ (datasets in hand now $> 2 \text{ fb}^{-1}$)

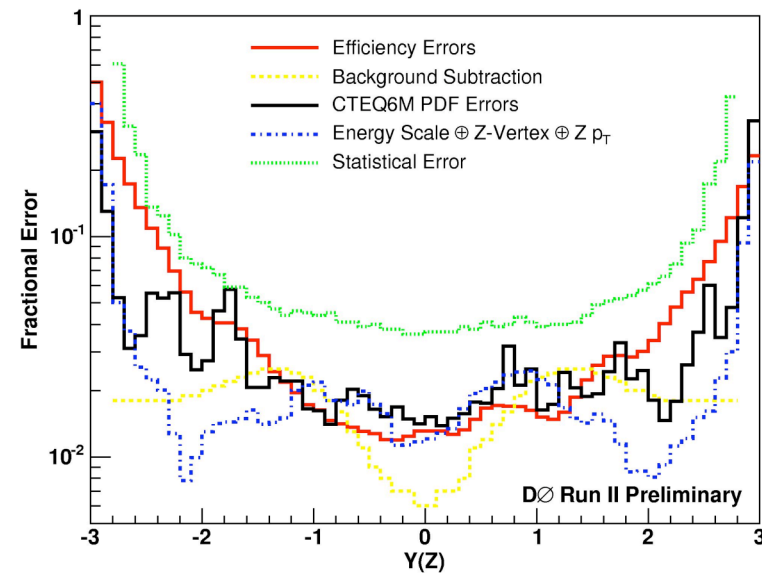

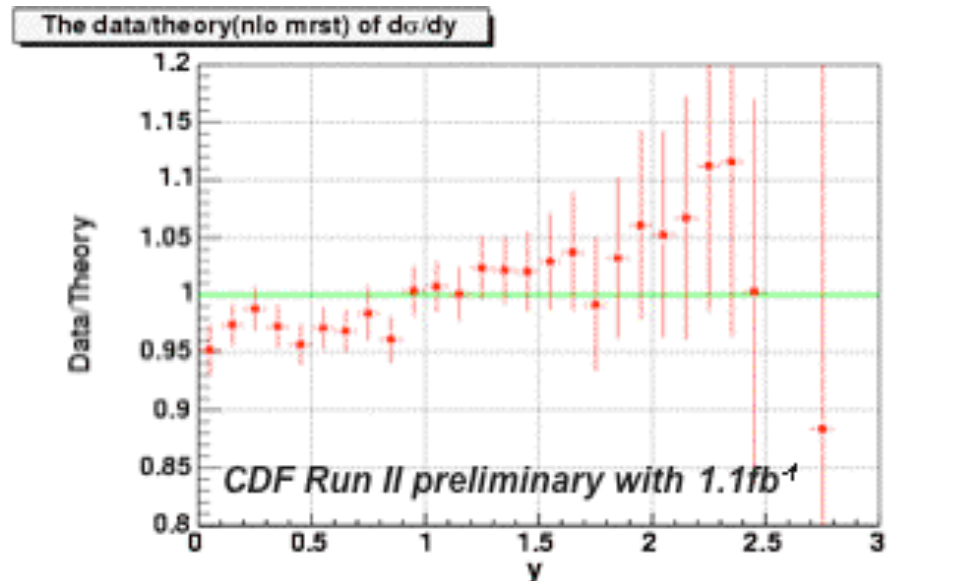

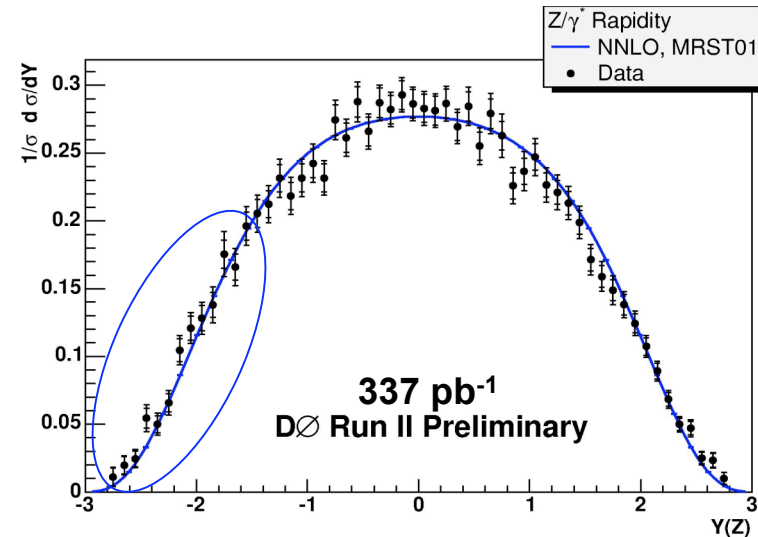

Drell Yan Rapidity

- Z boson rapidity well measured from decay leptons

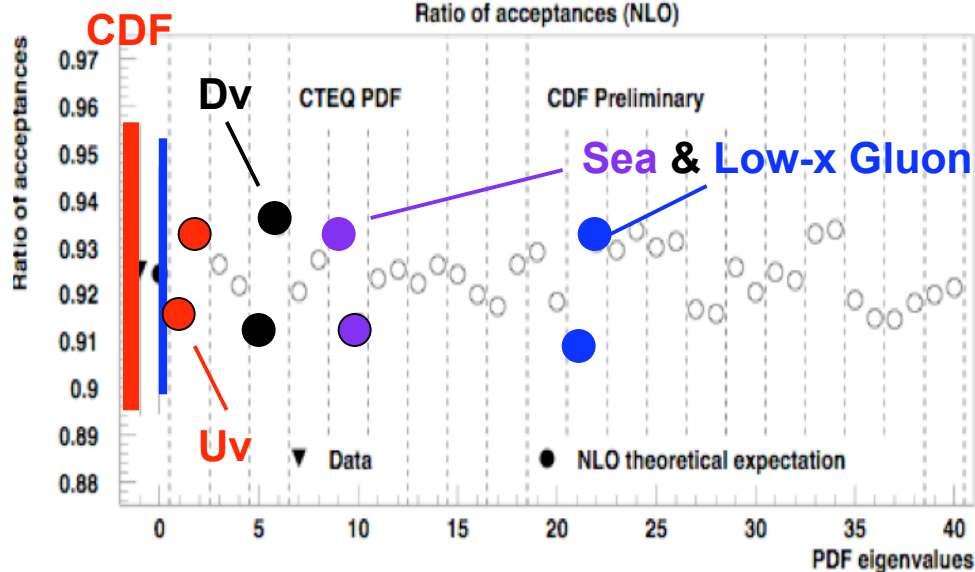

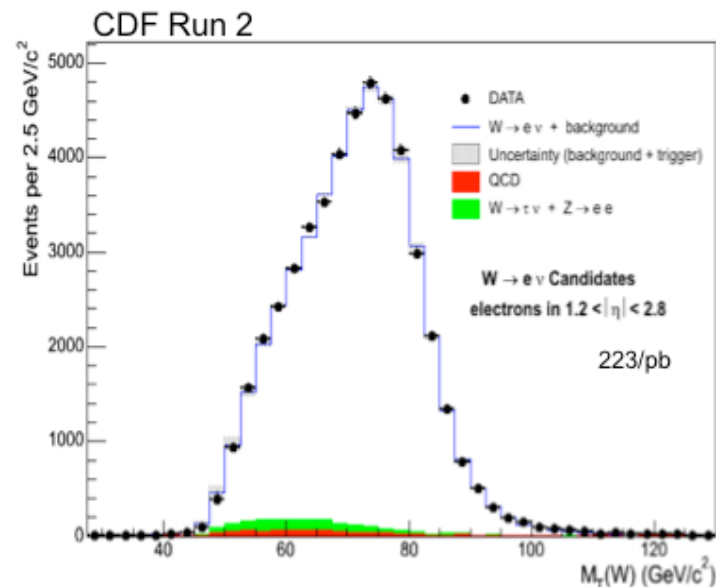

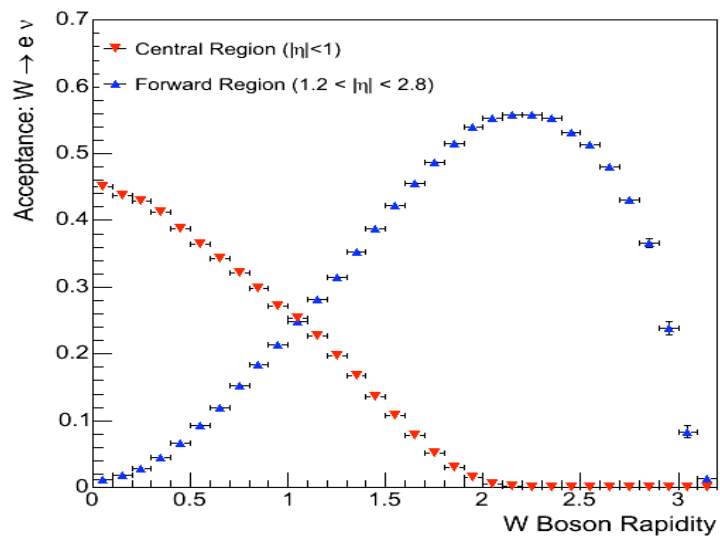

$$Y_Z = 0.5 \ln \left(\frac{x_p}{x_{\bar{p}}} \right) \quad \text{High } Y_Z \text{ Probes one high } x \text{ \& one low } x \text{ parton}$$

Deviations at 1-sigma level from present PDFs at high-x

Forward Ws

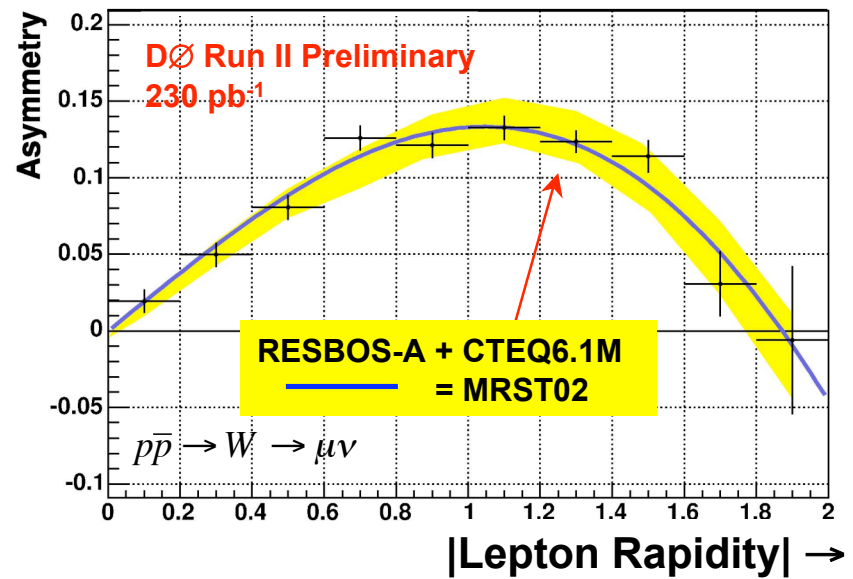

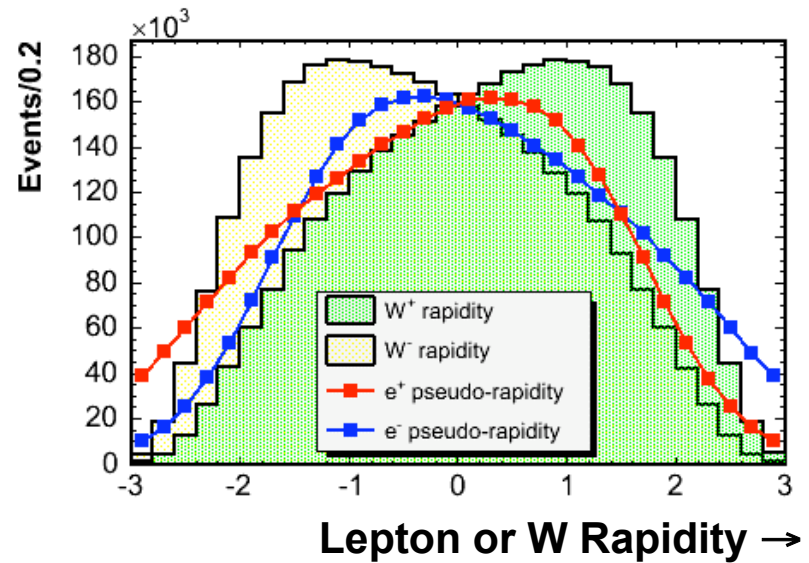

W Charge Asymmetry

- W^+ boosted in proton direction
since u quark momentum $>$ d quark

- but we measure a lepton charge asymmetry

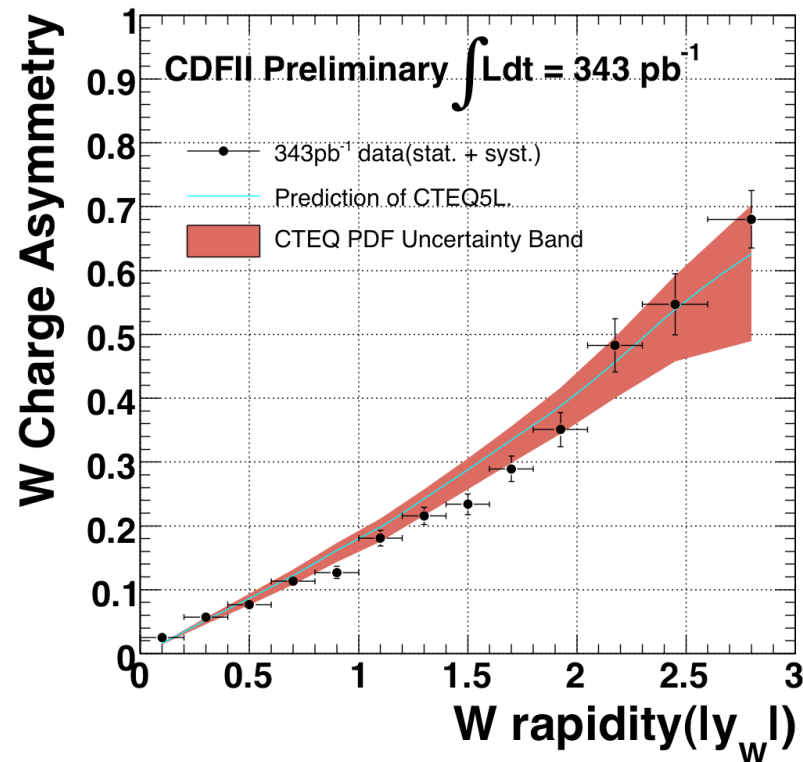

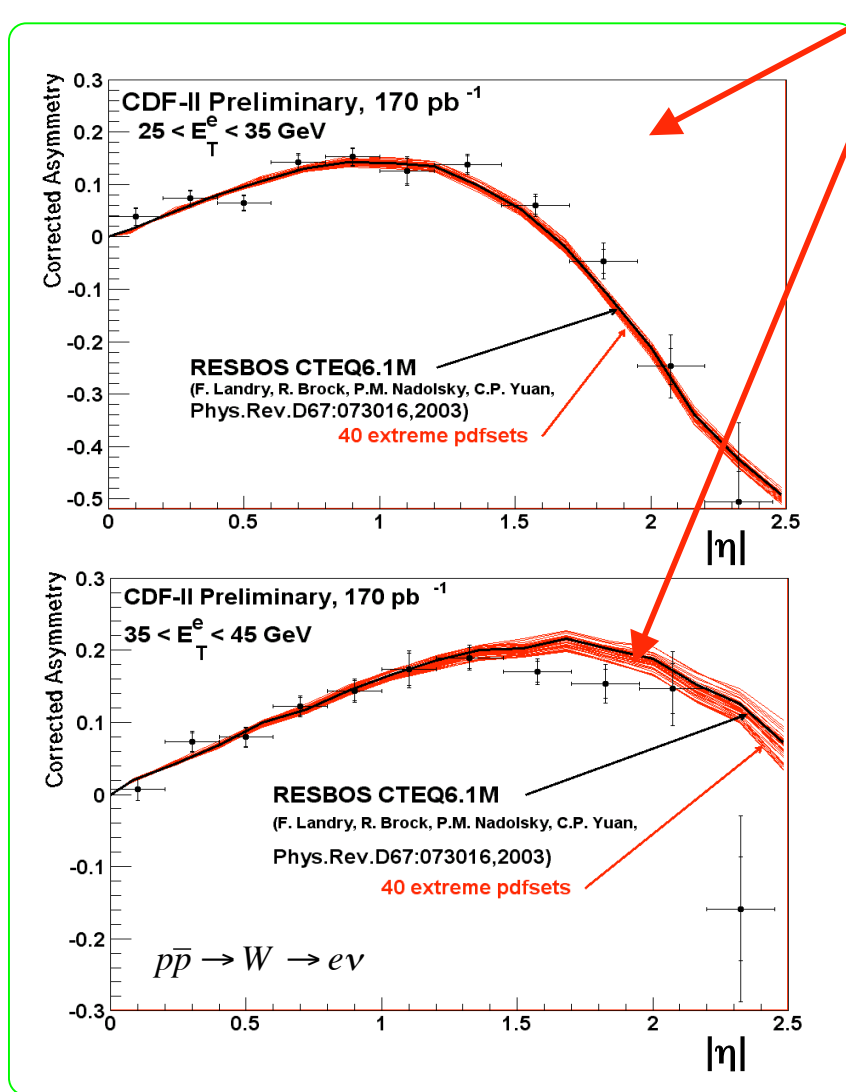

W Charge Asymmetry

Improved constraints if split data by E_T

Ultimately best constraints by measuring W charge asymmetry using weighted iterative estimate of W rapidity.

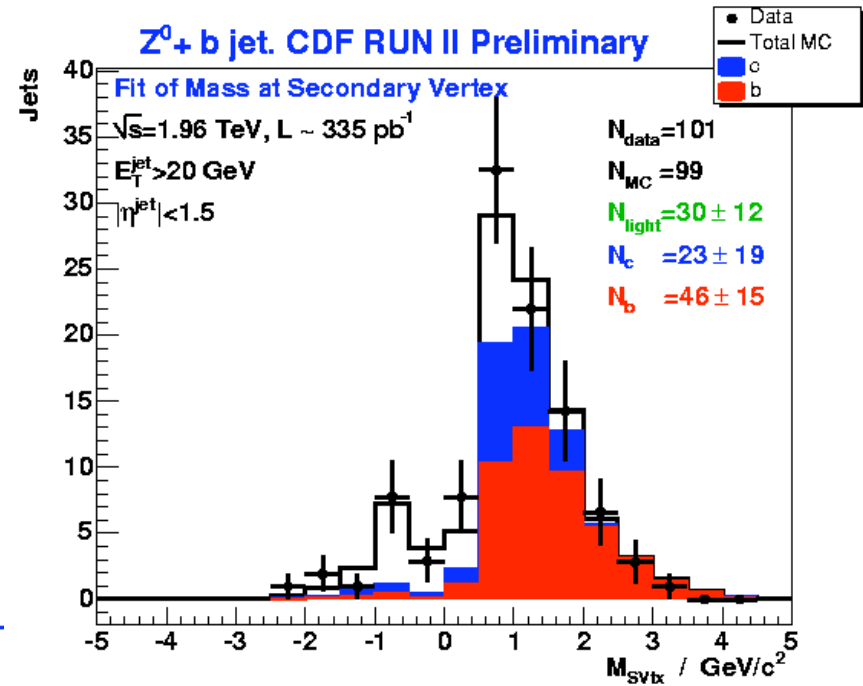

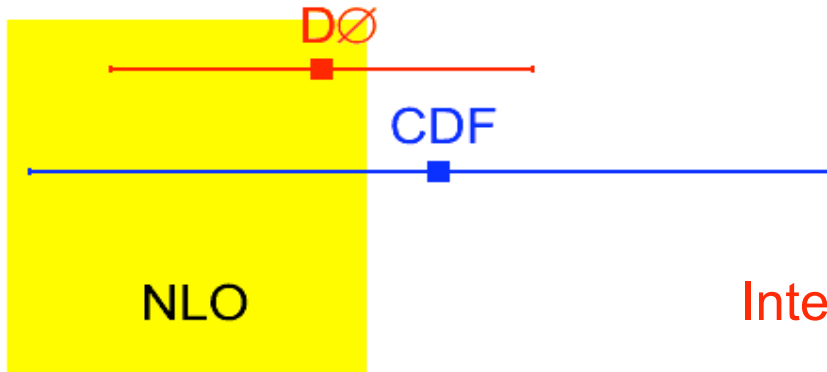

Z + b Cross Section

probe proton
b quark (and
gluon) content

Interesting multi-scale problem

Conclusions

- Tevatron W & Z measurements probe x - Q^2 region complementing HERA and close in Q^2 and with sufficient x coverage to aid in LHC PDFs
- Precision of measurements already such that PDF information in many cases is more precise than present CTEQ6 and MRST bounds & this is being fed into current CTEQ7 and MSTW fits
- Datasets size will increase up to 10-fold and thus expect significant further improvements which will be particularly important for future Tevatron and LHC measurements.
