

Fault Tracking at the LHC

Reliability of Accelerators
for Accelerator Driven Systems, 22-06-2015

Chris Roderick *on behalf of AFT team*

(Jakub Janczyk, Isabelle Laugier, Sergio Pasinelli, Laurette Ponce, Pawel Wilk, Bartlomiej Urbaniec, Piotr Sowinski)

Purpose of Fault Tracking

Purpose of Fault Tracking

Complete & Consistent Tracking will allow to **identify**:

- **Problems as early as possible**
👉 allowing for timely mitigation
- **Key issues** which will **limit performance** of accelerators or equipment in the future (Run2, Run3, HL-LHC)

Purpose of Fault Tracking

Complete & Consistent Tracking will allow to **identify**:

- **Problems as early as possible**
👉 allowing for timely mitigation
- **Key issues** which will **limit performance** of accelerators or equipment in the future (Run2, Run3, HL-LHC)

Aim: **Increase availability**, both short and long-term, by dealing with issues ASAP

Purpose of Fault Tracking

Complete & Consistent Tracking will allow to **identify**:

- **Problems as early as possible**
👉 allowing for timely mitigation
- **Key issues** which will **limit performance** of accelerators or equipment in the future (Run2, Run3, HL-LHC)

Aim: **Increase availability**, both short and long-term, by dealing with issues ASAP

Track faults in two areas:

Purpose of Fault Tracking

Complete & Consistent Tracking will allow to **identify**:

- **Problems as early as possible**
👉 allowing for timely mitigation
- **Key issues** which will **limit performance** of accelerators or equipment in the future (Run2, Run3, HL-LHC)

Aim: **Increase availability**, both short and long-term, by dealing with issues ASAP

Track faults in two areas:

1. Directly affecting accelerator operation – identify root causes

Purpose of Fault Tracking

Complete & Consistent Tracking will allow to **identify**:

- **Problems as early as possible**
👉 allowing for timely mitigation
- **Key issues** which will **limit performance** of accelerators or equipment in the future (Run2, Run3, HL-LHC)

Aim: **Increase availability**, both short and long-term, by dealing with issues ASAP

Track faults in two areas:

1. Directly affecting accelerator operation – identify root causes
2. Equipment faults independently of immediate impact on accelerator operation

What has been done in the Past

What has been done in the Past

Lots of different tools, used by different teams, for logging of faults:

- eLogbook, Post-Mortem, Radiation Working Group pages, tools in equipment groups (JIRA, Excel, Onenote, eLogbook)

What has been done in the Past

Lots of different tools, used by different teams, for logging of faults:

- eLogbook, Post-Mortem, Radiation Working Group pages, tools in equipment groups (JIRA, Excel, Onenote, eLogbook)

Lots of effort required from individuals-teams-working groups to gather and exploit fault data

What has been done in the Past

Lots of different tools, used by different teams, for logging of faults:

- eLogbook, Post-Mortem, Radiation Working Group pages, tools in equipment groups (JIRA, Excel, Onenote, eLogbook)

Lots of effort required from individuals-teams-working groups to gather and exploit fault data

Nevertheless, **difficult to get a consistent picture**

RadWG NEWS - QPS fault on RQTL11.R7B2

View: Version History, Alert Me, Edit Item, Manage Permissions, Delete Item, Manage, Actions

Title: QPS fault on RQTL11.R7B2

Body: two earlier cases due to SEE -> signature will be compared (recovered by power cycling)
comment QPS team:
RR77 DQGPU E-RR77 RQTL11.R7B2 DQDQG #2A 20-09-2011 04:18:59.197
Soft error likely but no PM data, lack of PM data meanwhile understood

LHC point: Point 7
Area: DS
Caused by SEE: YES
Event Type: soft SEE
Beam Dump: Yes
Equipment Type: QPS
Equipment Failure Mode: Other
Mitigation Measures: Not Known
Effective Date: 20/09/2011
LHC Fill #: 2,127
Expires:

Accelerator Fault Tracking Project

Accelerator Fault Tracking Project

BE Department Project, launched February 2014

Accelerator Fault Tracking Project

BE Department Project, **launched February 2014**

Based on initial inputs from:

- LHC Beam Operation Workshops
- Availability Working Group
- Workshop on Machine Availability & Dependability for Post-LS1 LHC
- Beam Operations teams

Accelerator Fault Tracking Project

BE Department Project, **launched February 2014**

Based on initial inputs from:

- LHC Beam Operation Workshops
- Availability Working Group
- Workshop on Machine Availability & Dependability for Post-LS1 LHC
- Beam Operations teams

Goals:

- Capture **consistent & complete fault data**
- **Facilitate** fault tracking for all interested parties (OP, equipment groups, working groups)
- **Single source of data** – **easier to complete, clean & analyse.**
- Provide **consistent - standardised statistics, analyses, reports** for different uses (daily / weekly reports for meetings and follow-up providing easy summaries)
- Interactive overview of faults (**cardiogram on demand**)
- Proactively identify incomplete data

AFT Planning

AFT Planning

Provide infrastructure to *consistently & coherently* capture, persist and make available **accelerator fault data** for further analysis.

AFT Planning

Provide infrastructure to *consistently & coherently* capture, persist and make available **accelerator fault data** for further analysis.

Foreseen project stages:

AFT Planning

Provide infrastructure to *consistently & coherently* capture, persist and make available **accelerator fault data** for further analysis.

Foreseen project stages:

1. Put in place a fault tracking infrastructure to capture **LHC fault data** from an **operational perspective**
 - Enable **data exploitation by others** (e.g. AWG and OP) to identify areas to improve accelerator availability for physics
 - **Ready before LHC beam commissioning**
 - Infrastructure should already **support capture of equipment group fault data**, but **not primary focus**

AFT Planning

Provide infrastructure to *consistently & coherently* capture, persist and make available **accelerator fault data** for further analysis.

Foreseen project stages:

1. Put in place a fault tracking infrastructure to capture **LHC fault data** from an **operational perspective**
 - Enable **data exploitation by others** (e.g. AWG and OP) to identify areas to improve accelerator availability for physics
 - **Ready before LHC beam commissioning**
 - Infrastructure should already **support capture of equipment group fault data**, but **not primary focus**
2. Focus on **equipment group fault data** capture

AFT Planning

Provide infrastructure to *consistently & coherently* capture, persist and make available **accelerator fault data** for further analysis.

Foreseen project stages:

1. Put in place a fault tracking infrastructure to capture **LHC fault data** from an **operational perspective**
 - Enable **data exploitation by others** (e.g. AWG and OP) to identify areas to improve accelerator availability for physics
 - **Ready before LHC beam commissioning**
 - Infrastructure should already **support capture of equipment group fault data**, but **not primary focus**
2. Focus on **equipment group fault data** capture
3. Explore **integration with other CERN data management systems** (e.g. Infor EAM)
 - potential to perform deeper analyses of system and equipment availability
 - in turn - start predicting and improving dependability

AFT Planning

Provide infrastructure to *consistently & coherently* capture, persist and make available **accelerator fault data** for further analysis.

Foreseen project stages:

1. Put in place a fault tracking infrastructure to capture **LHC fault data** from an **operational perspective**
 - Enable **data exploitation by others** (e.g. AWG and OP) to identify areas to improve accelerator availability for physics
 - **Ready before LHC beam commissioning**
 - Infrastructure should already **support capture of equipment group fault data**, but **not primary focus**
2. Focus on **equipment group fault data** capture
3. Explore **integration with other CERN data management systems** (e.g. Infor EAM)
 - potential to perform deeper analyses of system and equipment availability
 - in turn - start predicting and improving dependability

To support data analysis, AFT data extraction infrastructure should also provide data complimentary to the actual fault data - such as accelerator operational modes and states.

AFT Planning

Provide infrastructure to **consistently & coherently** capture, persist and make available **accelerator fault data** for further analysis.

Foreseen project stages:

1. Put in place a fault tracking infrastructure to capture **LHC fault data** from an **operational perspective**

Fault Updates by AWG

In order to **ensure coherent data**, weekly review by Availability Working Group

The screenshot displays a web application interface for fault management. At the top, there is a navigation menu with links: Home, Register Fault, Search Faults, Statistics, Reports, Cardioqram, Support, and Login. Below the navigation, there is a search bar with a 'Search' button and an 'Interval' dropdown menu set to '-- Select value --'. On the left side, there is a 'Filter' section with two dropdown menus: 'By State:' (set to 'All Values') and 'By System:' (set to 'All Values'). Below these, there is a checkbox for 'Exclude child faults' and a 'Clear Filters' button. The main content area shows a table of faults with columns: Name, Start Time, End Time, OP Duration, and State. The table contains several rows of fault data, including entries for 'LHC » Injectors » No beam' and 'LHC » Operation » Operational error'. A 'Login' modal is overlaid on the table, containing fields for 'Login:' and 'Password:', 'Cancel' and 'Login' buttons, and a yellow note: 'Note: Clicking cancel will discard all the unsaved changes.' At the bottom of the table, a 'View' and 'Edit fault' button is visible for one of the fault entries.

2015 Week 22

Monday (25.05)

00:56 - 00:58 Duration: 0d 00h 02m 01s	LHC » LBDS » XPOC
07:57 - 08:30 Duration: 0d 00h 33m 11s	LHC » Cryogenics » Controls MR8 cryo start and maintain lost
16:55 - 18:03 Duration: 0d 01h 08m 34s	LHC » Vacuum » Pressure Closing of VPIZ.683382.B caused a trigger of the LBDS (B1)
18:14 - 22:28 Duration: 0d 04h 13m 55s	LHC » QPS » Hardware precycle needed
23:22 - 23:58 Duration: 0d 00h 35m 57s	LHC » Operation » Operational error TI2/TI8 HS opened when trying to open Injection HS

Tuesday (26.05)

01:10 - 01:11 Duration: 0d 00h 01m 45s	LHC » Beam Loss » UFO
02:14 - 02:14 Duration: 0d 00h 00m 01s	LHC » Operation » Operational error
03:52 - 03:52	LHC » Beam Loss » UFO

Start Time: 09-05-2015 22:52:05
OP End Time: 10-05-2015 23:14:35
Expert End Time:
Creation Time: 09-05-2015 22:53:43
OP duration: 1d 00h 22m 30s
Expert duration: 43d 14h 06m 55s
Description:

Creator: [redacted]
Source: LHC Logbook
System: LHC » Cryogenics » CV
Classification:
Fault state: OP Ended
eLogbook: [link](#)

Prevents Injection	Access Needed	RP Needed
×	×	×

Parent fault:
[LHC » Technical Services » Cooling/Ventilation](#)

Child faults:

Faults blocking current fault:

Faults blocked by current fault:

Faults state changes:

State change time	State	Creator
09-05-2015 22:52:05	Blocking OP	[redacted]
10-05-2015 23:14:35	OP Ended	[redacted]

Next Steps

Current focus is on usability / time saving features

Followed by additional statistics & improved reports

Then Phase 2 - inclusion of data from equipment groups

and Phase 3 - integration with other systems e.g. Asset & Intervention Management

Summary

Summary

Consistent & Complete Fault Tracking is key to identify and efficiently mitigate issues

Summary

Consistent & Complete Fault Tracking is key to identify and efficiently mitigate issues

AFT already eases the recording of LHC faults and identification of root causes in a complete and consistent way. There is huge potential to bring further added value.

Summary

Consistent & Complete Fault Tracking is key to identify and efficiently mitigate issues

AFT already eases the recording of LHC faults and identification of root causes in a complete and consistent way. There is huge potential to bring further added value.

Run2 data will be essential to identify future performance-availability limitations towards HL-LHC

Summary

Consistent & Complete Fault Tracking is key to identify and efficiently mitigate issues

AFT already eases the recording of LHC faults and identification of root causes in a complete and consistent way. There is huge potential to bring further added value.

Run2 data will be essential to identify future performance-availability limitations towards HL-LHC

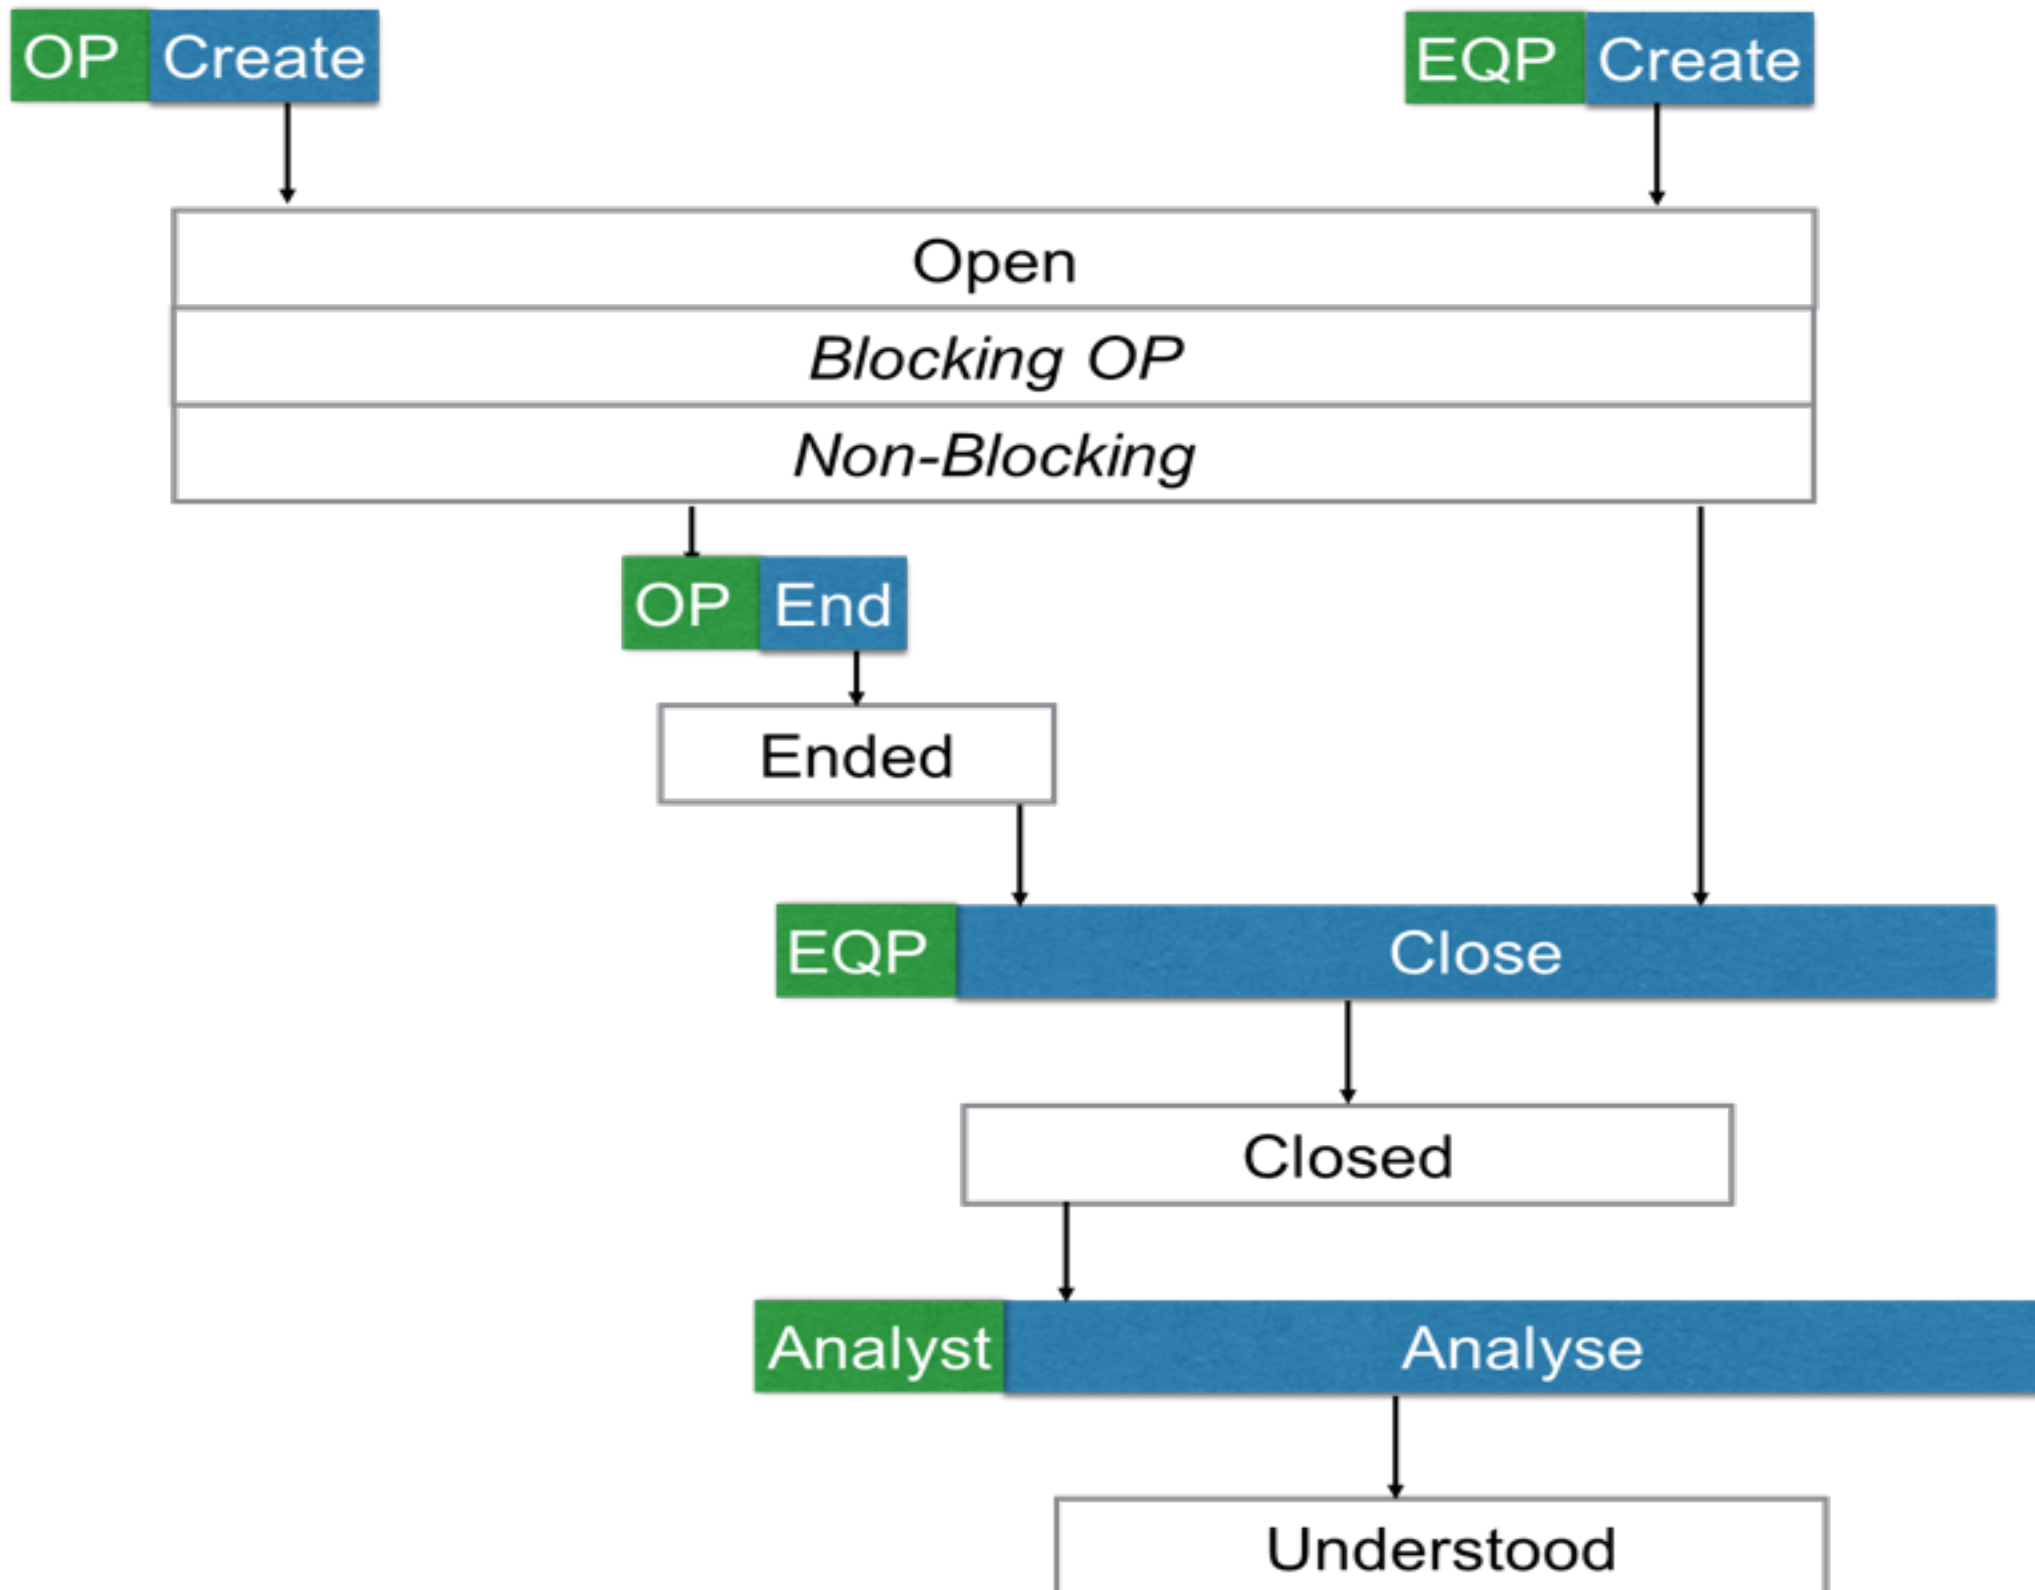

Quality and completeness of the data requires effort from all involved parties

Roles and simplified workflow

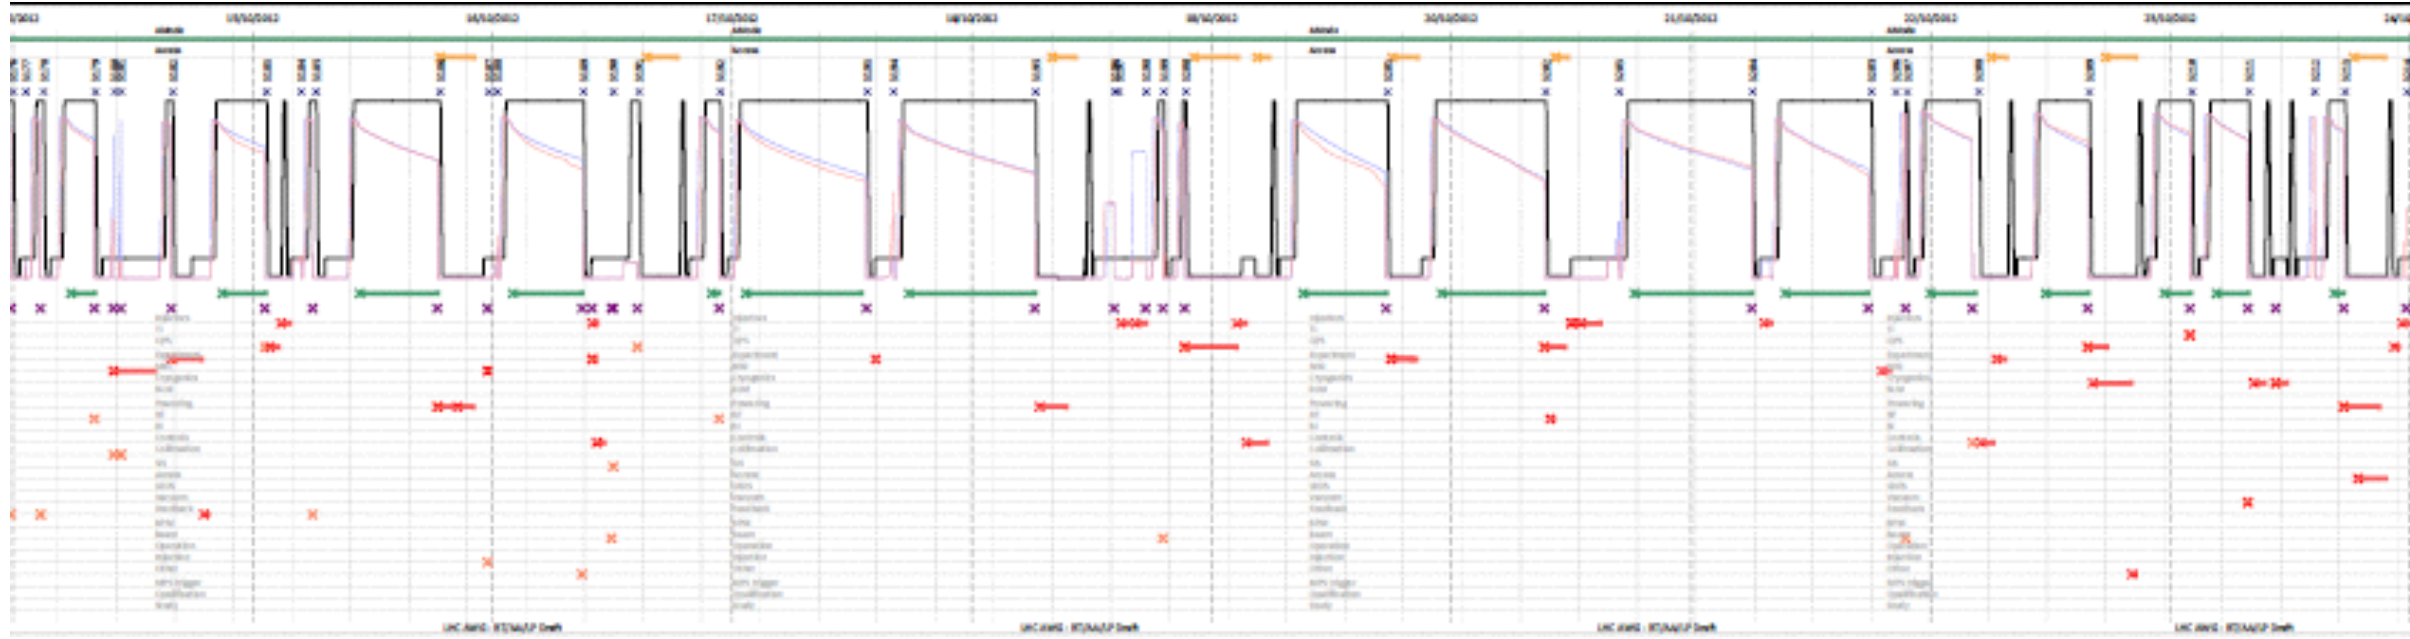

2010

2011

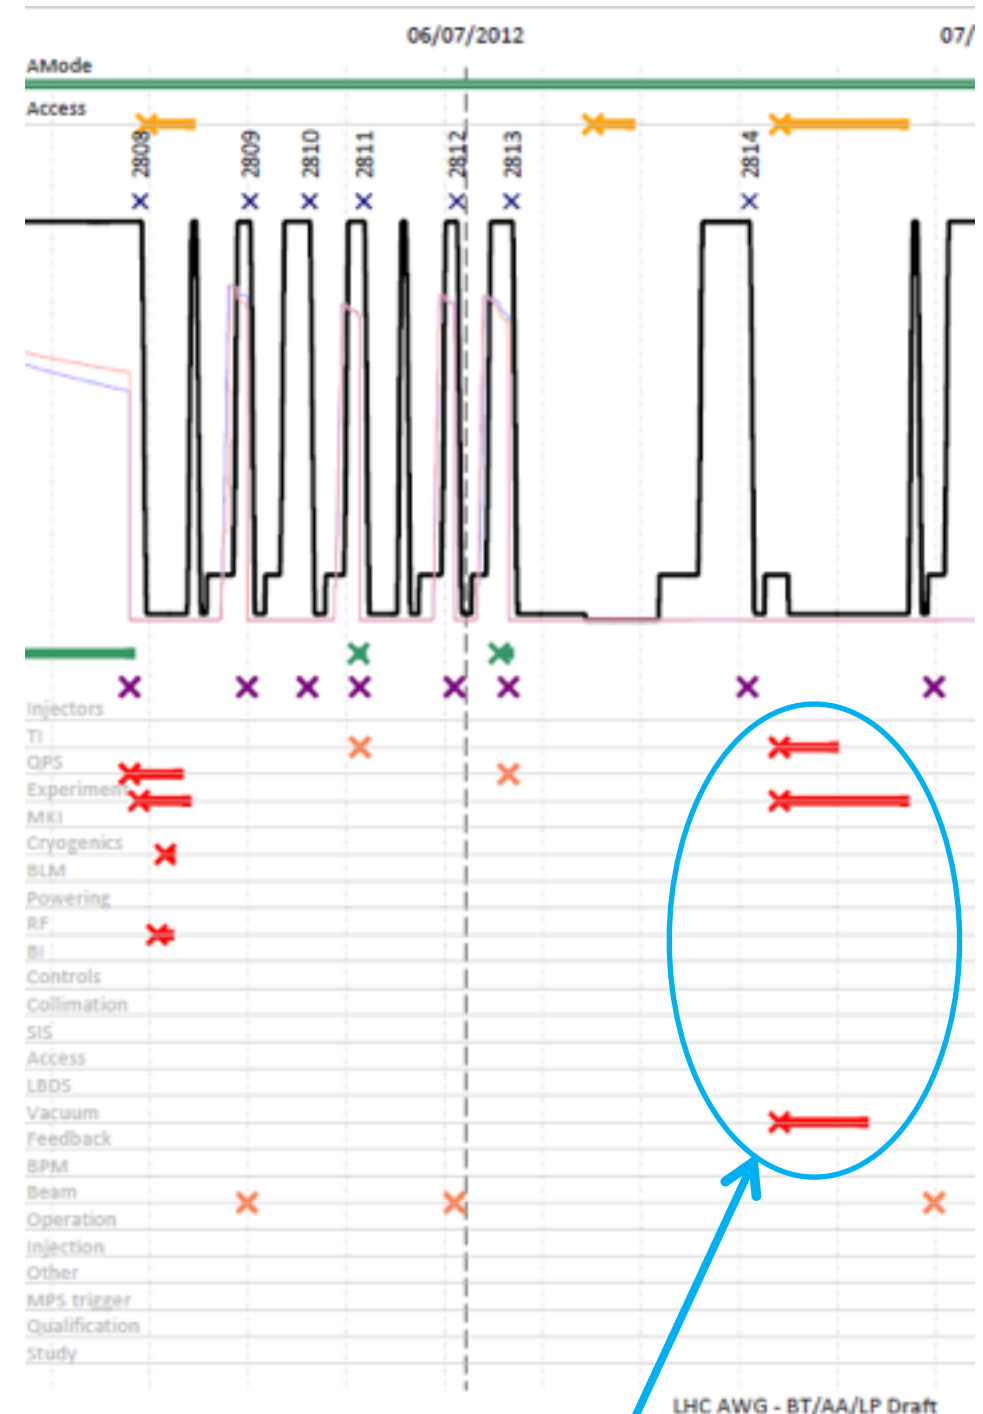

2012

Multiple failures

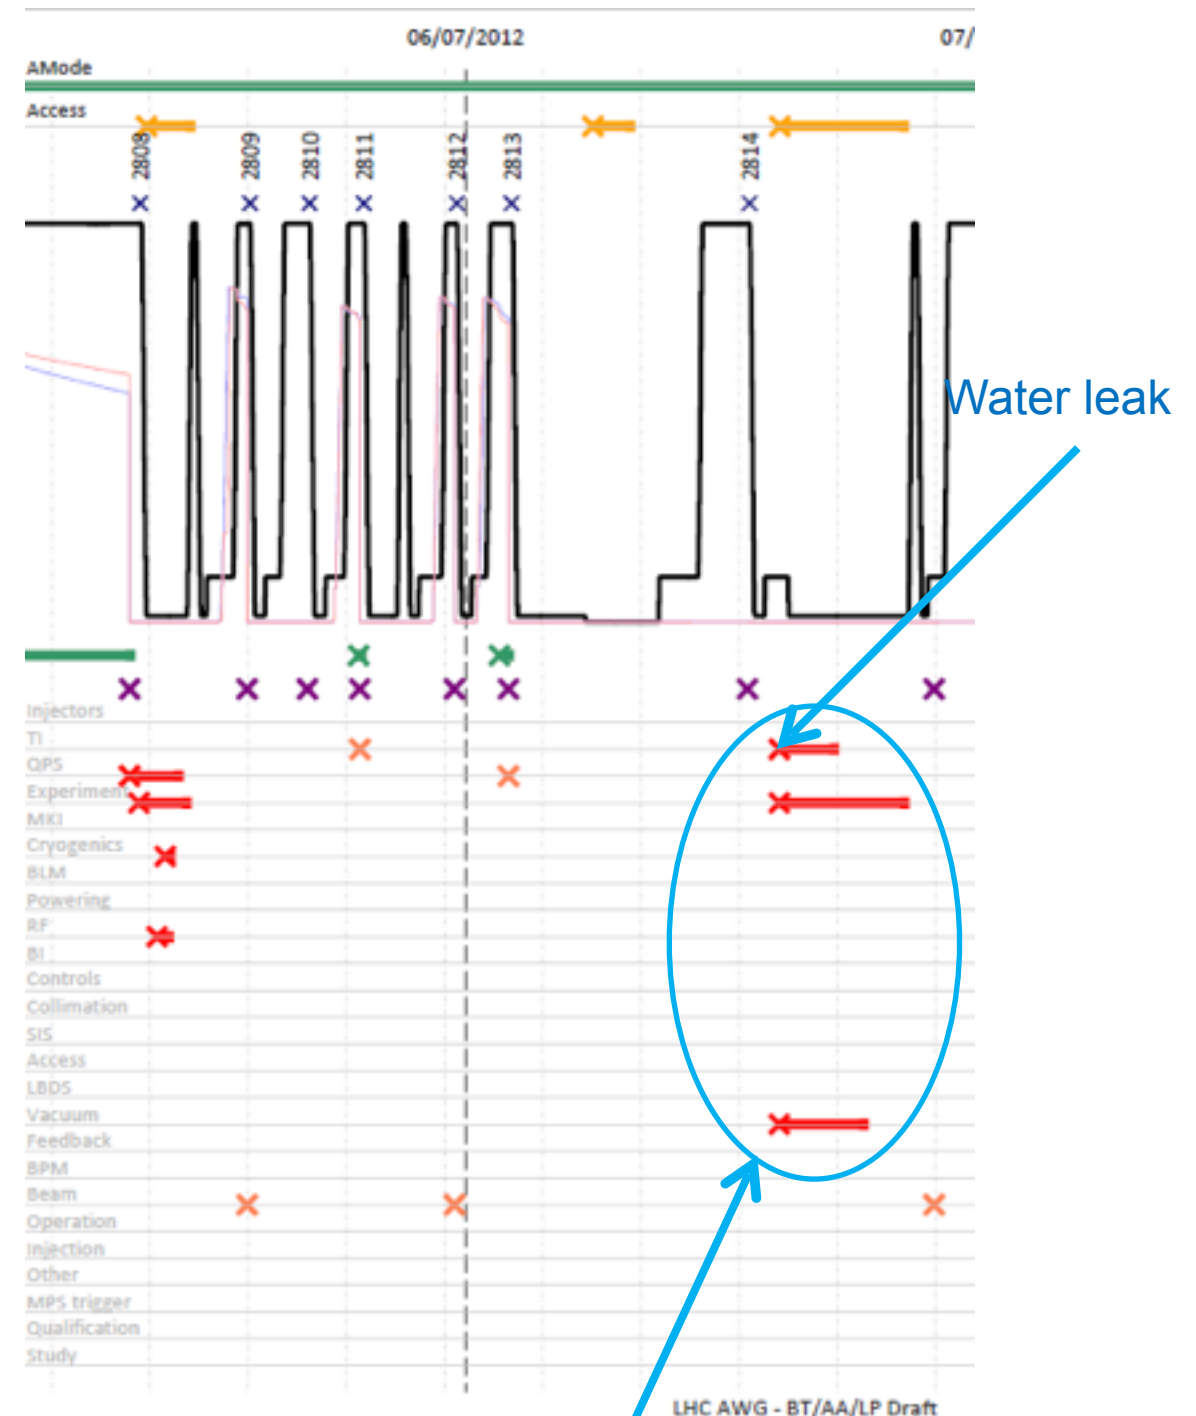

Multiple failures

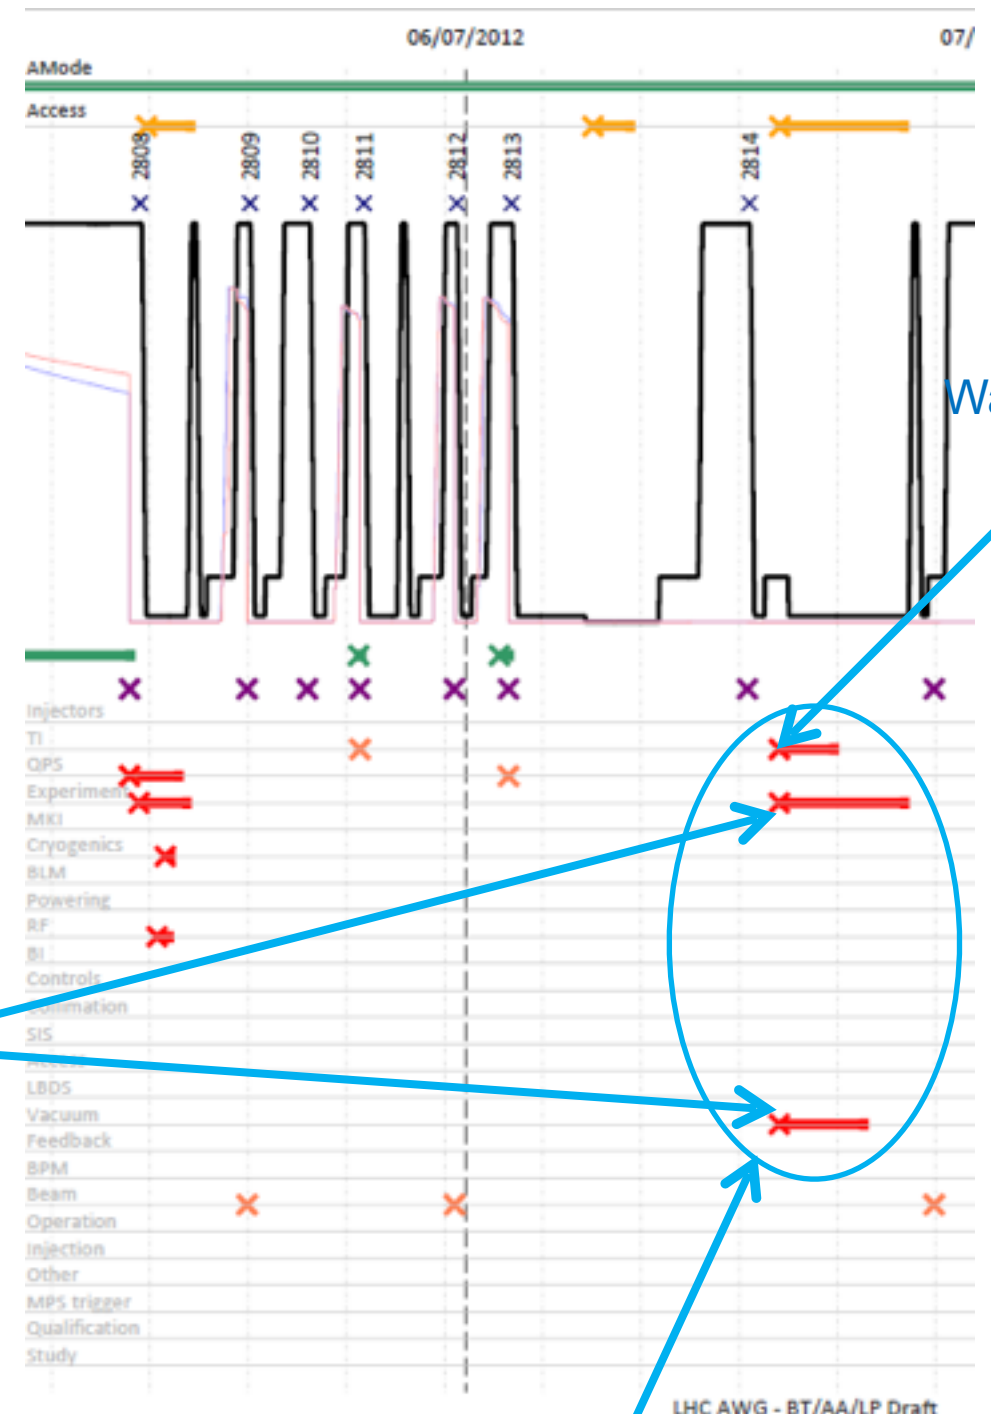

Faults related

Multiple failures

Faults related

Multiple failures

Water leak

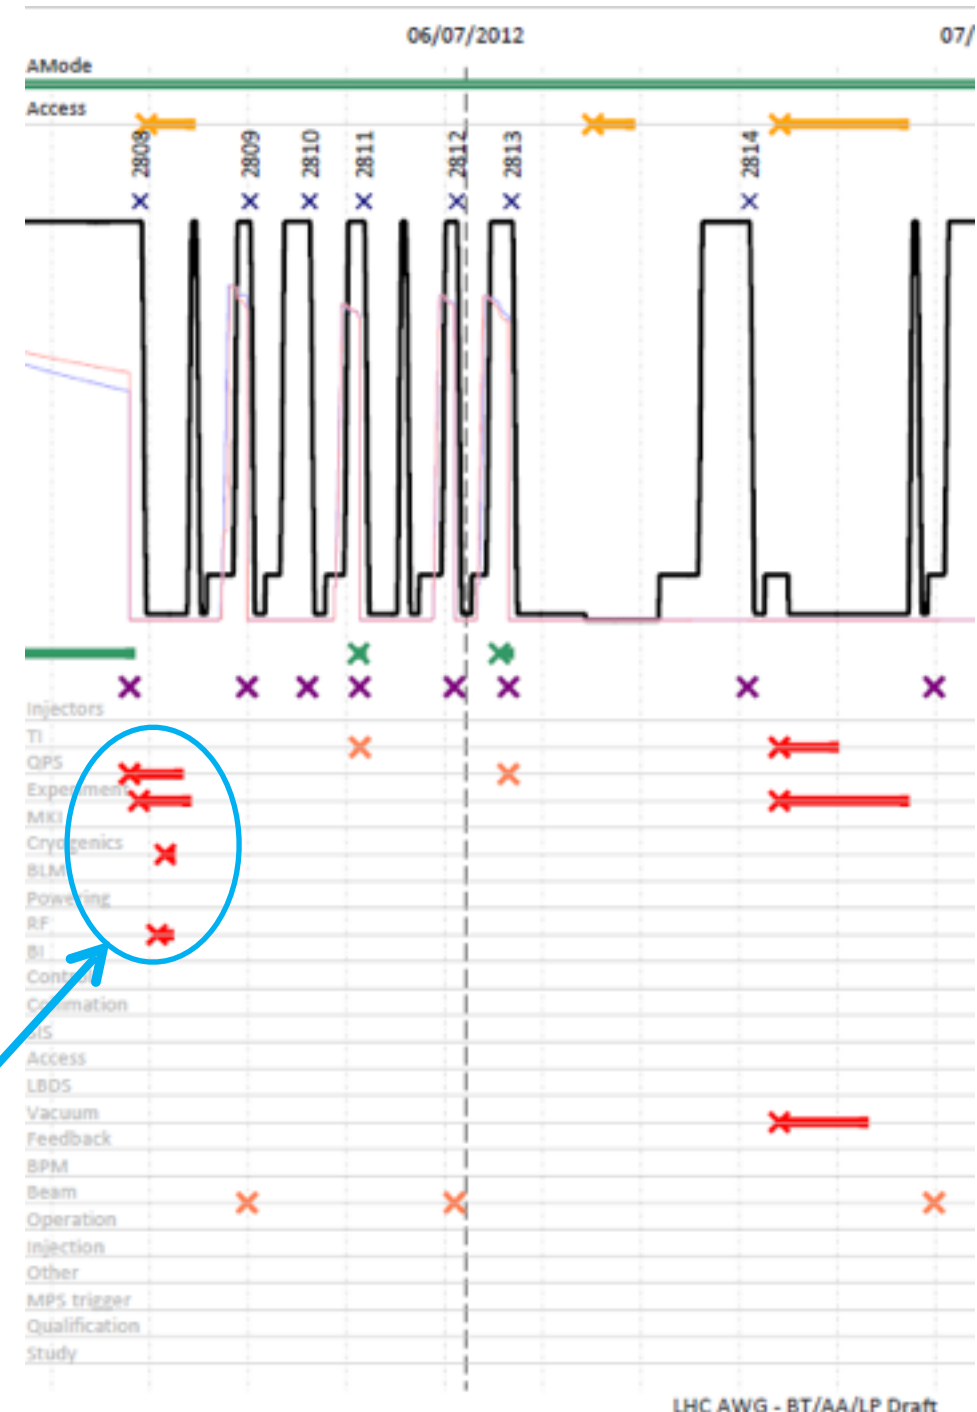

Problems caused by water leak

Faults related

Multiple failures

Multiple failures

Faults not related –
QPS failed and rest of
them are accesses
in shadow

Multiple failures

Multiple failures

- It is easy to see if there are multiple failures at the same time, but it's not obvious if they are related.
- One of the goal of AFT project is to capture data that will allow to show the relations between faults.

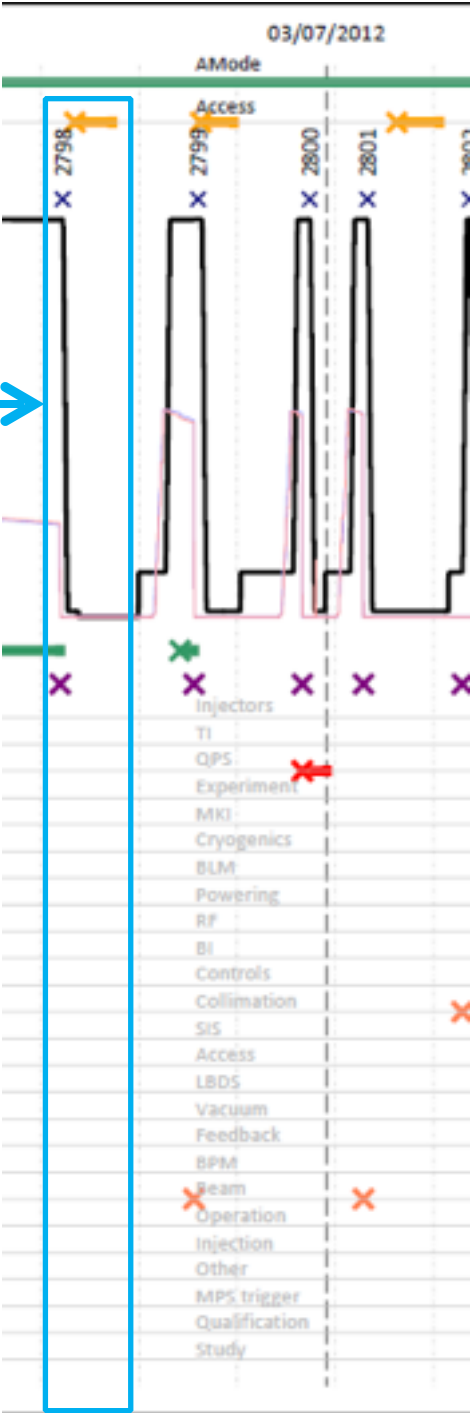

Access without faults

- In 2012, around 40 times there was access without any fault
- The reasons for these accesses are not classified, but often something is repaired
- Inconsistent data – cardiogram allows to spot this

Access without faults - examples

Access without faults - examples

Few accesses:
ATLAS,
Change of PC,
repair of QPS,
intervention on the
crates of the BPMD

Access without faults - examples

Access without faults - examples

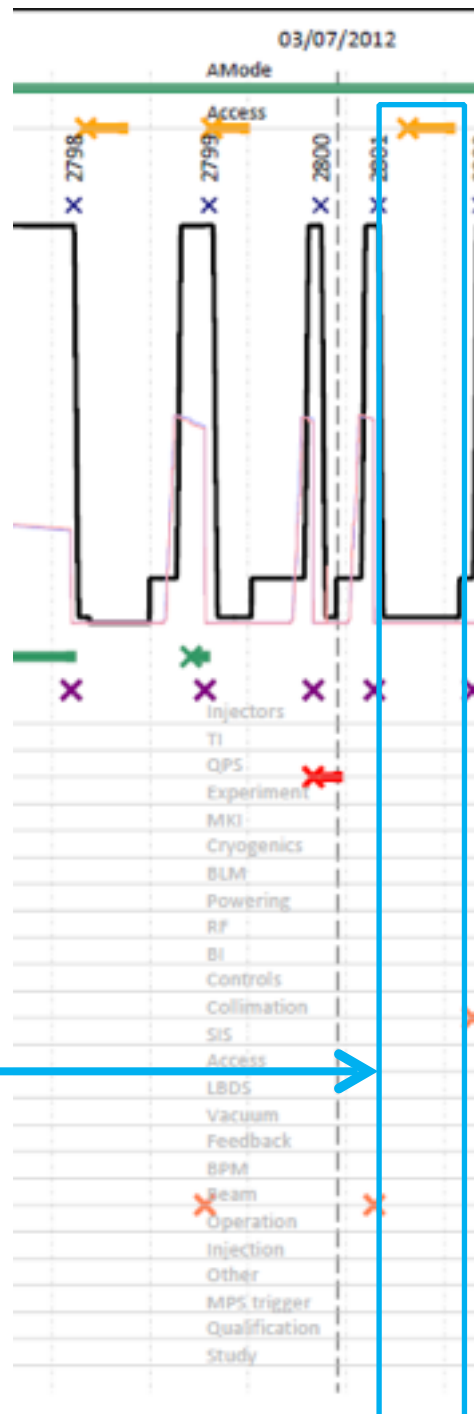

LHCb – fixing muon detectors

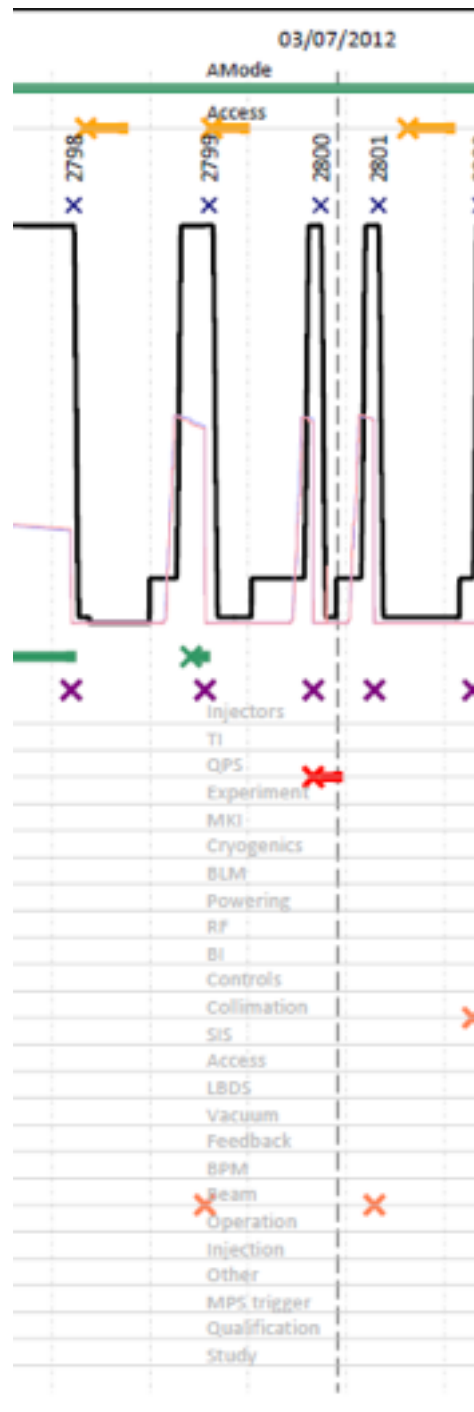

Access without faults - examples

Access without faults - examples

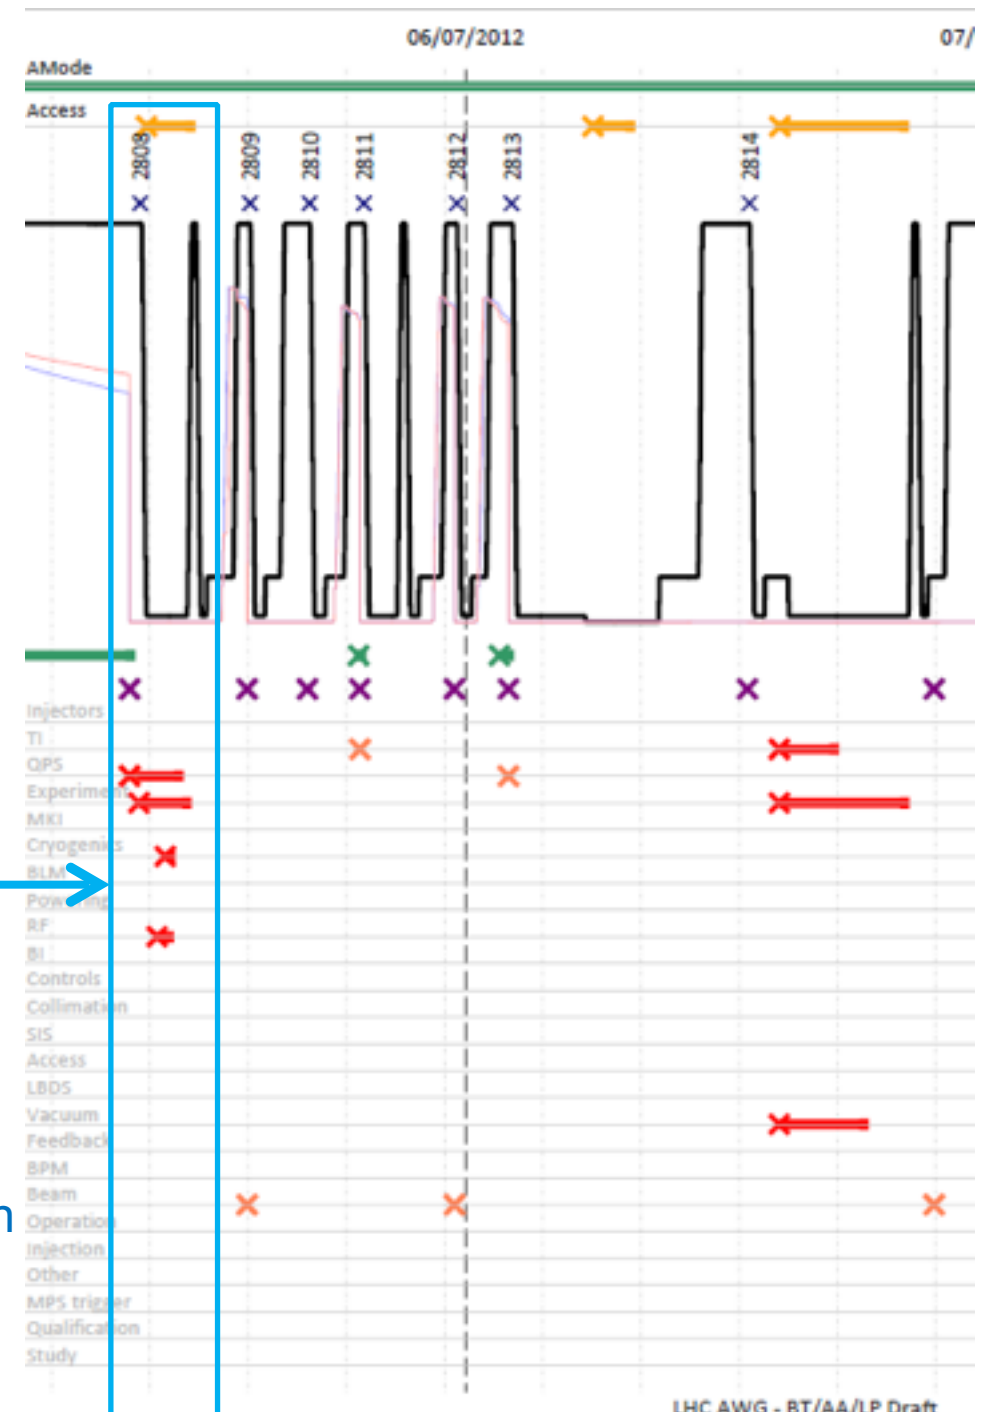

Access without faults - examples

Access without faults - examples

Accesses in shadow of QPS fail:
QPS – reset cards, ALICE and CMS,
Cryogenics – valve regulation,
RF – replacing broken attenuator

Access without faults - examples
