RECERCA I ESTUDIS AVANÇATS

# What is physics beyond the Standard Model?

I don't know. Nobody knows

If it were known, it would be part of the SM!

You won't learn during these lectures what is BSM

you'll learn what BSM could be

*"Looking and not finding is different than not looking"*

we'll study the limitations/defaults of the SM as a guide towards BSM

# Outline

## □ Monday

- general introduction, units

## □ Tuesday

- Higgs physics as a door to BSM

## □ Wednesday

- Naturalness: small and large numbers in a quantum world

## □ Thursday

- grand unification, proton decay

- supersymmetry

- extra dimensions

## □ Friday

- cosmological interplay

# Recommended Readings

## □ popular account

- "The Zeptospace odyssey" by Gian-Francesco Giudice [CERN library link](#)

## □ fun physics

- "Order-of-magnitude physics" by S. Mahajan, S. Phinney and P. Goldreich [available for free online](#)

## □ technical accounts

- "Journeys beyond the Standard Model" by P. Ramond [CERN library link](#)

# *The elementary particles*

# Particle physics is special

- *Chemistry: reorganization of matter*

the various constituents of matter reorganize themselves in different structures

- *Particle physics: transformation matter  $\leftrightarrow$  energy*

NB:  $Q, L_e, L_\mu, B$  = conserved quantities

# Classical vs. Quantum Collisions

Compton  
wavelength

$$\lambda = \frac{\hbar}{mc}$$

strawberry :  $m \sim 30 \text{ g} \sim 10^{25} \text{ GeV}/c^2 \Rightarrow \lambda \sim 10^{-40} \text{ m}$

classical :  $\lambda \ll R$

quantum :  $\lambda \gg R$

$e^-$  :  $m \sim 9.1 \times 10^{-31} \text{ kg} \sim 0.5 \text{ MeV}/c^2 \Rightarrow \lambda \sim 10^{-13} \text{ m}$

$p$  :  $m \sim 1.6 \times 10^{-27} \text{ kg} \sim 1 \text{ GeV}/c^2 \Rightarrow \lambda \sim 10^{-16} \text{ m}$

# Vacuum fluctuations

attractive force between two neutral plates

ideal conductors (electric conductivity= $\infty$ ) and uncharged

$E$ =energy of virtual photons between the plates

$E \searrow$  when  $L \searrow \rightarrow$  attractive force

Casimir (1948)

( $S \gg L^2$ : no boundary effects)

Force per unit area

$$\frac{dF}{dS} = -\frac{\pi^2}{240} \frac{\hbar c}{L^4}$$

Annotations for the equation:

- $\hbar$ : QM (Quantum Mechanics)
- $c$ : Special Relativity
- $\frac{\pi^2}{240}$ : non-trivial coefficient
- $L^4$ : dim. analysis (dimensional analysis)

numerically: pressure of  $\sim 1$  atm for a 10nm separation

The quantum vacuum is not empty

# Energy Scales of Particle Physics

$e^-$   
 $v=0$        $e^- \rightarrow$   
 $v \sim 700 \text{ km/s}$

$$1 \text{ TeV} = 10^{12} \text{ eV}$$

1 eV = energy of an electron accelerated  
by a potential difference of 1 volt

$$1 \text{ eV} = 1.6 \times 10^{-19} \text{ Joule}$$

1 kg sugar = 4000 kCalories = 17 millions of Joule  
but 1 kg sugar  $\approx 10^{27}$  protons  
0.1 eV / protons

If one wanted to accelerate each protons contained in 1kg of sugar to 14 TeV, (s)he would need the caloric energy contained in  $10^{14}$  kg of sugar\* or 1% of the total energy produced yearly

\*yearly worldwide production of sugar = 150 millions of tons  $\approx 10^{11}$  kg

# Classical/Quantum EM & Antimatter

an electron makes an electric field which carries an energy

$$\Delta E_{\text{Coulomb}}(r) = \frac{1}{4\pi\epsilon_0} \frac{e^2}{r}$$

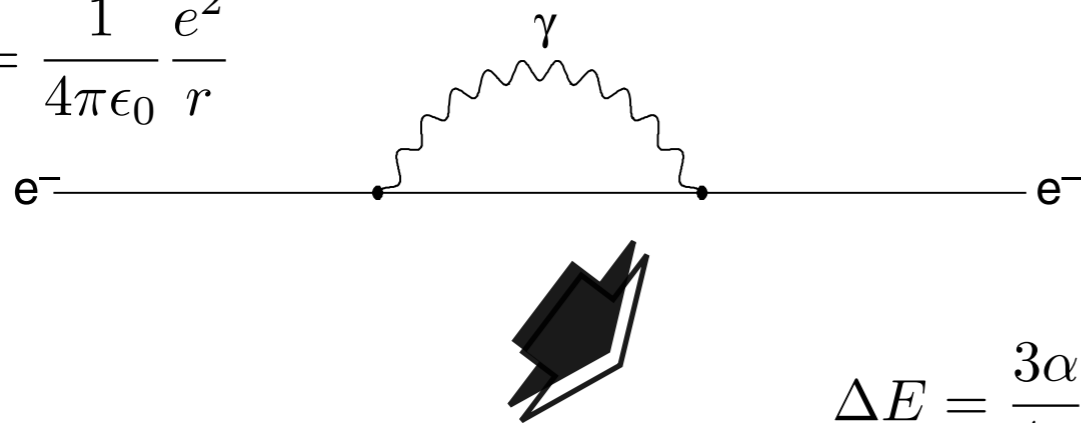

and interacts back to the electron and contributes to its mass  $\delta m c^2 = \Delta E$

$$\delta m < m_e \quad \Rightarrow \quad r > r_e \equiv \frac{e^2}{4\pi\epsilon_0 m_e c^2} \sim 10^{-13} \text{ m i.e. } E < \frac{\hbar c}{r_e} \sim 5 \text{ MeV}$$

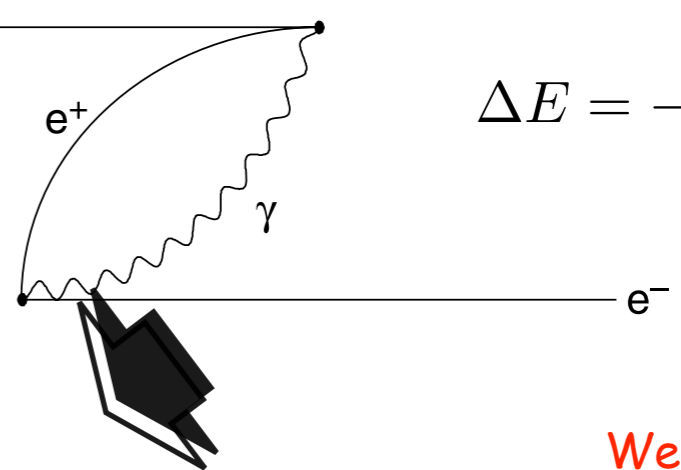

At shortest distances or larger energies, classical EM breaks down

## Quantum EM

$$\Delta E = \frac{1}{4\pi\epsilon_0} \frac{e^2}{r}$$

$$\Delta E = -\frac{1}{4\pi\epsilon_0} \frac{e^2}{r}$$

$$\Delta E = \frac{3\alpha}{4\pi} m_e c^2 \log \frac{\hbar}{r m_e c}$$

Weisskopf '39

new states  $\approx$  softer high-energy (UV) behavior:  $\delta m < 0.1 m_e \Rightarrow E < 10^{21} \text{ GeV}$

# Antimatter and Dirac equation

Schrödinger's equation (1926) is non-relativistic

(cannot account for creation/annihilation of particles)

Schrödinger Equation (1926): 
$$\left( i\hbar \frac{\partial}{\partial t} + \frac{\hbar^2}{2m} \Delta - V \right) \Phi = 0$$

$E = \frac{p^2}{2m} + V$       classical  $\leftrightarrow$  quantum  
correspondance       $E \rightarrow i\hbar \frac{\partial}{\partial t}$  &  $p \rightarrow i\hbar \frac{\partial}{\partial x}$

Klein-Gordon Equation (1927): 
$$\left( \frac{1}{c^2} \frac{\partial^2}{\partial t^2} - \Delta + \frac{m^2 c^2}{\hbar^2} \right) \Phi = 0$$

$\frac{E^2}{c^2} = p^2 + m^2 c^2$

Dirac Equation (1928): 
$$\left( i\gamma^\mu \partial_\mu - \frac{mc}{\hbar} \right) \Psi = 0$$

$E = \begin{cases} +\sqrt{p^2 c^2 + m^2 c^4} & \text{matter} \\ -\sqrt{p^2 c^2 + m^2 c^4} & \text{antimatter} \end{cases}$        $E = \vec{\alpha} \vec{p} c + \beta mc^2$

$\gamma^0 = \beta, \gamma^i = \beta \alpha^i, \{\gamma^\mu, \gamma^\nu\} = 2\eta^{\mu\nu}$

positron ( $e^+$ ) discovered by C. Anderson in 1932

# The Standard Model: Matter

how many quarks and leptons?

Three Generations of Matter (Fermions) spin  $\frac{1}{2}$

an easy question... a complicated answer!

# The Standard Model: Matter

how many quarks and leptons?

6+6=12?

6x3+6=24?

shouldn't we count different color states?

6x3x2+3x2+3=45?

it is an accident that  $e_L \sim e_R$  for QED  
SM is a chiral theory:  $e_L \neq e_R$

6x3x2+6x2=48?

are there  $\nu_R$ ?  
are they part of the SM?

Three Generations of Matter (Fermions) spin  $\frac{1}{2}$

an easy question... a complicated answer!

# *The fundamental interactions*

# Interactions between Particles

*The very observation that the sun is shining for several millennia tells us that there are various mechanisms of energy production.*

## Sun = gigantic source of energy

- ➔ 1 cm<sup>3</sup> of ice under the sun (in the summer) melts in ~ 40mn
- ➔ an ice cap 1 cm thick and 300 million km of diameter centered around the sun will melt in 40mn

energy produced by burning  $10^{19}$  liters of oil  
(~ volume Sun-Mercury/1000)

# Interactions between Particles

*The very observation that the sun is shining for several millennia tells us that there are various mechanisms of energy production.*

## Sun = gigantic source of energy

Darwin ("On the origin of species by means of natural selection", 1<sup>st</sup> edition, 1859) estimates that the age of the Earth, and thus the age of the Sun also, has to be larger than 300 millions of years to account for the erosion of hills in South England.

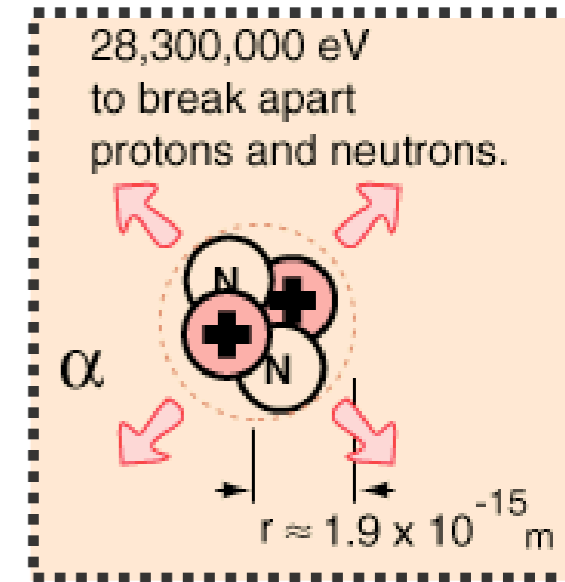

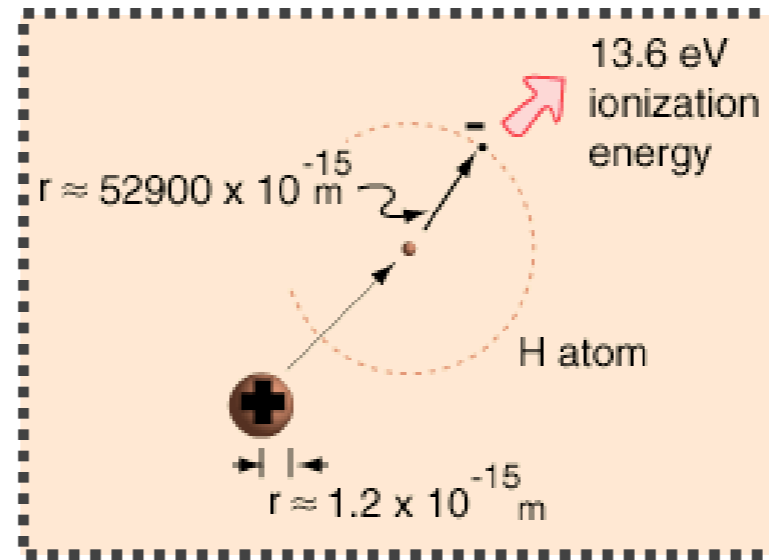

Thompson, Lord Kelvin, computes the gravitational energy of the Sun and with the assumption that it is entirely converted in heat, concludes that the Sun cannot be older than 20 million years (chemical energy would allow the Sun to shine for at most 3000 years)

We know today that the Sun is more than 4.5 billion years

# Different Interactions

## Atomic Physics

mass of an atom = mass of nucleus + masses of electrons

example : hydrogen atom, mass  $\sim 1 \text{ GeV}$ , binding energy  $\sim 13 \text{ eV}$

$\Rightarrow 10^{-8}$

## Nuclear Physics

mass of a nucleus  $< \Sigma$  masses of protons and neutrons

example : Helium nucleus, mass  $\sim 4 \text{ GeV}$ , binding energy  $\sim 28 \text{ MeV}$

$\Rightarrow 10^{-2}$

## Particle Physics

mass of a proton or a neutron  $\gg \Sigma$  masses of quarks

proton mass  $\sim 1 \text{ GeV}$ , constituent quarks masses  $\sim 12 \text{ MeV}$

$\Rightarrow 10^2$

# The Standard Model: Interactions

Even though EM is way stronger than gravity, it was unnoticed until  $\sim 300$  years because  $1-1=0$

## electromagnetic interactions

(1873, Maxwell)

tested with an accuracy of  $10^{-8}$

## weak interactions

(1933, Fermi)

tested with an accuracy of  $10^{-3}$

## strong interactions

tested with an accuracy of  $10^{-1}$

(1911, Rutherford; 1921, Chadwick and Biesler)
