

Searches for Neutral 2HDM, MSSM and NMSSM Higgs Bosons at the LHC

The Third Annual Large Hadron Collider Physics Conference
St. Petersburg

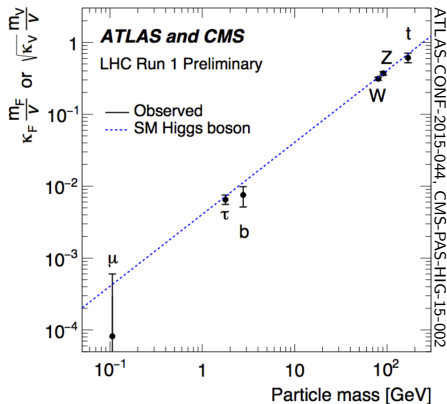

Matthias Schröder (KIT)
on behalf of the ATLAS and CMS Collaborations

September 4, 2015

First New Particle at the LHC: First Sign of New Physics?

- 1) What are the properties of the new boson?
 - ▶ Couplings compatible with SM expectation
 - ▶ But room for BSM behaviour
- 2) *Here:* Is it part of an extended Higgs sector?
 - ▶ Constraint: BSM models must contain a SM-like Higgs boson at 125 GeV

→ **Direct searches for additional Higgs bosons!**

Models with Extended Higgs Sectors

previous presentation
by Eduard Boos

Supersymmetry

- Minimal supersymmetric extension **MSSM**
 - ▶ 2 Higgs doublets \rightarrow **5 physical bosons**
 - ★ $h, H, A \equiv \Phi$ (neutral), H^+, H^- (charged)
 - ▶ 2 tree-level parameters m_A and $\tan \beta = v_{ev_u}/v_{ev_d}$
 - ★ Other SUSY parameters enter via radiative corrections, fixed in benchmark scenarios
 - ▶ Data: preference for h being the 125 GeV state
- Next-to-MSSM **NMSSM**
 - ▶ 1 additional Higgs singlet \rightarrow **7 bosons**

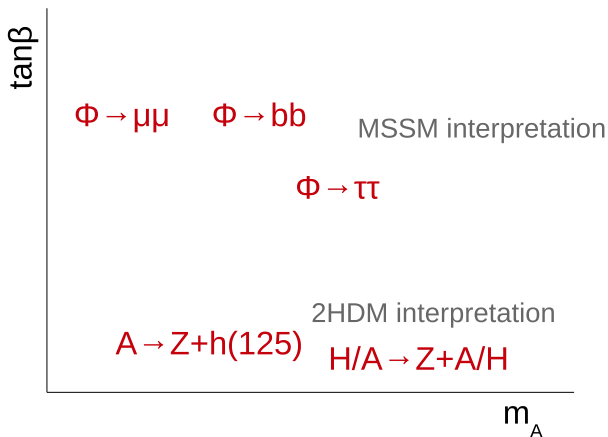

Generic 2-Higgs-Doublet Models **2HDM**

- Effective extension of Standard Model adding a Higgs doublet
 - ▶ 5 parameters (no FCNC, $m_h = 125$ GeV):
 $m_A, m_H, m_{H^\pm}, \tan \beta, \alpha = h$ - H mixing
- Different types depending on coupling structure
 - ▶ Type II: u - and d -type fermions couple to different doublets (MSSM)

Numerous Neutral-BSM-Higgs-Boson Searches at the LHC

Outline: will present **a few recent results**

NMSSM inspired $h(125) \rightarrow aa \rightarrow \mu\mu\tau\tau$ $h(125) \rightarrow aa \rightarrow 4\gamma$

Numerous Neutral-BSM-Higgs-Boson Searches at the LHC

Outline: will present **a few recent results**

Further **NEW** results with 2HDM interpretation:

- Heavy $H \rightarrow ZZ$ search at ATLAS arXiv:1507.05930 (submitted to Eur. Phys. J.)
see *High mass searches for SM like Higgs bosons at the LHC* by Song-Ming Wang
- $H \rightarrow hh \rightarrow bb\tau\tau$ search at CMS, CMS-HIG-14-034
see *Searches for HH processes at LHC* by Andrea Rizzi

Pseudoscalar $A \rightarrow Z + h(125)$ Search at ATLAS & CMS

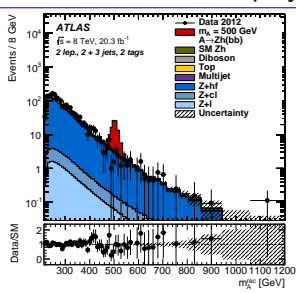

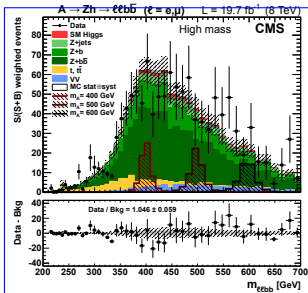

- Most 2HDMs: A predominantly produced by gluon-gluon fusion
- Often large $\mathcal{B}(A \rightarrow Z + h)$ for $m_h + m_Z \lesssim m_A \lesssim 2m_t$
 - ▶ MSSM: in low- $\tan\beta$ region
 - ▶ Can be important also above $2m_t$ in general 2HDMs

Pseudoscalar $A \rightarrow Z + h(125)$ Search at ATLAS & CMS

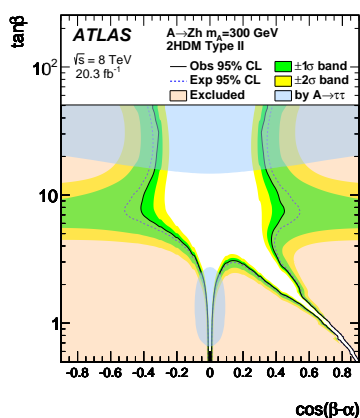

- $Z \rightarrow ll/\nu\nu$ clean signature
 - ▶ $\nu\nu$: ATLAS only
- $\mathcal{B}(h \rightarrow bb/\tau\tau)$ typically large
 - ▶ $\tau\tau$ CMS: CMS-HIG-14-034
- $m_h = 125$ GeV constraint deployed to improve resolution

Peak search in **invariant mass ($llbb/\tau\tau$)** and **transverse ($\nu\nu bb$)** mass

2HDM Interpretation

Exclusion limits in type-II 2HDM, $m_A = m_H = m_{H^\pm} = 300$ GeV

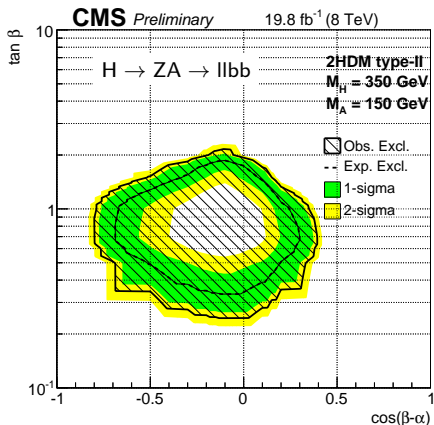

Large parts of type-II parameter-space excluded, also at high $\tan\beta$

NEW H/A \rightarrow Z(H) + A/H(bb/ $\tau\tau$) at CMS

- More general approach: no specific h(125) requirement in final state

- Type-II 2HDM interpretation
- Either mass hierarchy
 $m_A > m_H$ or $m_H > m_A$
- Complementary information to $A \rightarrow Zh(125)$ searches

Access to 'alignment' region at $\cos(\beta - \alpha) \approx 0$

MSSM Neutral Higgs-Boson Searches

small $\tan\beta$ 

gg-fusion production

→ no b-tagged jet

larger $\tan\beta$ 

b-assoc. production

→ ≥ 1 b-tagged jets $\Phi \rightarrow bb$ channel

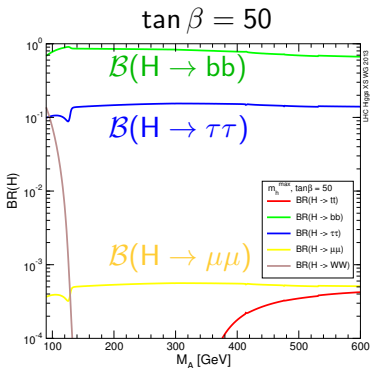

- Very large \mathcal{B}
- Challenging bkg

 $\Phi \rightarrow \tau\tau$ channel

- Relatively large \mathcal{B}
- Manageable bkg

 $\Phi \rightarrow \mu\mu$ channel

- Tiny \mathcal{B}
- Excellent mass resolution

$\Phi \rightarrow \tau\tau$ Searches: $m_{\tau\tau}$ Reconstruction

Likelihood approach

CMS (ATLAS similar)

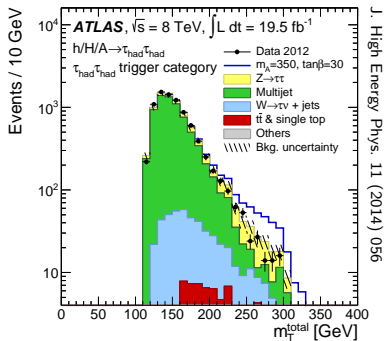

- Typical resolution of 20%

Total transverse mass

ATLAS in $\tau_h\tau_h$ channel

$$m_T(\tau_1, \tau_2) \oplus m_T(\tau_1, \cancel{E}_T) \oplus m_T(\tau_2, \cancel{E}_T)$$

- Improved separation of signal and QCD-multijet bkg

$\Phi \rightarrow \tau\tau$ Search at ATLAS

- Channels: $e\mu$, $e\tau_h$, $\mu\tau_h$, $\tau_h\tau_h$
- Event categories based on
 - ▶ Number of b-tagged jets
 - ▶ Low/high-mass specific selection
 - ▶ Used triggers
- Background composition depends on channel and category
- Major contributions measured from data
 - ▶ Similar techniques by ATLAS and CMS

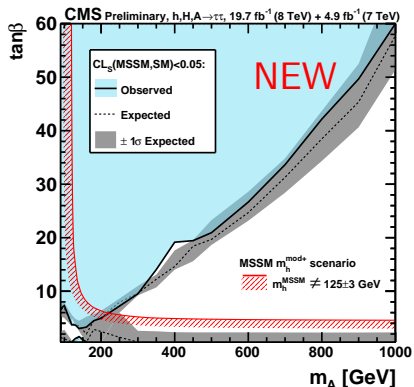

■ $Z \rightarrow \tau\tau$: embedding method in $Z \rightarrow \mu\mu$ data

■ QCD multijets: control sample with inverted τ_h -identification criteria

$\Phi \rightarrow \tau\tau$ Results

Exclusion limits on $\tan\beta$ in MSSM $m_h^{\text{mod}+}$ benchmark scenario

- Exclusion of $\tan\beta \gtrsim 5$ at low m_A , sensitivity up to 1 TeV
- Low $\tan\beta$ region incompatible with $m_h = 125$ GeV

Exclusion of low- $m_A \lesssim 200$ GeV region in $m_h^{\text{mod}+}$ scenario

NEW $\Phi \rightarrow b\bar{b}$ Search at CMS

- For not-too-small $\tan\beta$
 - ▶ Dominant $b\bar{b}\Phi$ production
 - ▶ Large $\mathcal{B}(\Phi \rightarrow b\bar{b}) \approx 90\%$
- Selection: ≥ 3 **b-tagged jets**

Peak search in **invariant mass distribution** M_{12} of leading two jets

- Huge QCD-multijet background
 - ▶ Largely reduced by 3 b-tag requirement
- Requires dedicated triggers with **online b-tagging**

Data-Driven Background Model

- **Template for each flavour combination** from 2 b-tag data
 - ▶ Weighted by b-tag probability of un-tagged jet
- Additional separation by condensed **event b-tag estimator** X_{123}
 - ▶ Based on secondary-vertex masses of 3 leading jets

2D (M_{12}, X_{123}) background (+signal) templates fit to data

Background-Only Fit Results

Projection on M_{12} and X_{123}

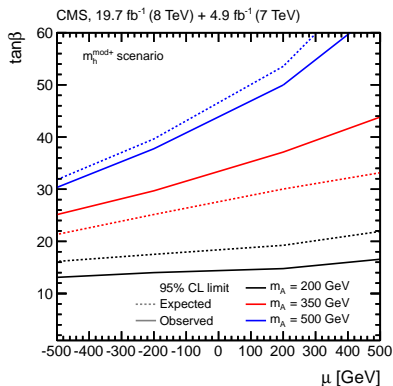

- Background dominated by processes with 3 b-jets ($\blacksquare + \blacksquare \approx 80\%$)

Data well described by background-only hypothesis

MSSM Interpretation

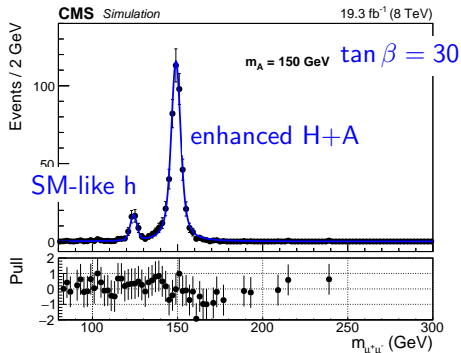

Exclusion limits on $\tan\beta$ in MSSM $m_h^{\text{mod}+}$ benchmark scenario

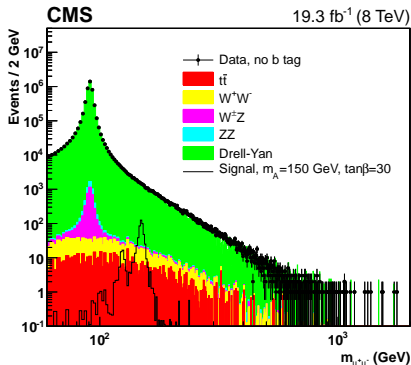

- Upper limits on $\tan\beta$ from 14–50
- Also dependence on Higgsino-mass parameter μ studied
 - ▶ Good sensitivity expected in this channel [Eur. Phys. J. C73 (2013) 2552]

NEW $\Phi \rightarrow \mu\mu$ Search at CMS

- Very low expected \mathcal{B}
- But excellent mass resolution
 - ▶ $\Delta m = 1.2$ GeV at 125 GeV
- Analytic signal+bkg model

Similar search by ATLAS using 7 TeV data
J. High Energy Phys. 02 (2013) 095

- Peak search in $m_{\mu\mu}$ distribution
 - ▶ Dominant bkg contribution from Drell-Yan production

Data well-described by background-only model

MSSM Interpretation

Exclusion limits on $\tan\beta$ in MSSM $m_h^{\text{mod}+}$ benchmark scenario

- Results from different channels complementing each other
 - ▶ Different mass resolution clearly visible (best for $\mu\mu$, worst for $\tau\tau$)
 - ▶ Most stringent limits from $\tau\tau$ channel, $b\bar{b}$ and $\mu\mu$ similar to each other

MSSM Interpretation

Exclusion limits on $\tan\beta$ in MSSM $m_h^{\text{mod}+}$ benchmark scenario

- Results from different channels complementing each other
 - ▶ Different mass resolution clearly visible (best for $\mu\mu$, worst for $\tau\tau$)
 - ▶ Most stringent limits from $\tau\tau$ channel, $b\bar{b}$ and $\mu\mu$ similar to each other

NEW NMSSM $h(125) \rightarrow aa \rightarrow \mu\mu\tau\tau$ Search at ATLAS

- Low expected $\mathcal{B}(a \rightarrow \mu\mu)$
- But high trigger efficiency and narrow di- μ resonance

Peak search in $m_{\mu\mu}$ distribution
from 3.7–50 GeV

- Analytic signal + bkg model
 - ▶ Assuming $\mathcal{B}(a \rightarrow \mu\mu) + \mathcal{B}(a \rightarrow \tau\tau) = 1$

Results

- Data well-described by background-only model
 - ▶ $J/\psi, \psi', \Upsilon_{1S}, \Upsilon_{2S}, \Upsilon_{3S}, Z$ resonances + $t\bar{t}$ + Drell-Yan continuum
- Exclusion limit on $\sigma(gg \rightarrow h) \times \mathcal{B}(h \rightarrow aa)$
 - ▶ Relative to SM gluon-gluon-fusion Higgs-boson production

NEW NMSSM $h(125) \rightarrow aa \rightarrow 4\gamma$ Search at ATLAS

- Events with ≥ 3 identified photons
- Peak search in $m_{\gamma_2\gamma_3}$ distribution

Exclusion limit on $\sigma/\sigma_{\text{SM}}(gg \rightarrow h) \times \mathcal{B}(h \rightarrow aa) \times \mathcal{B}^2(a \rightarrow \gamma\gamma)$

- Additional $H \rightarrow aa$ interpretation

Are there any further Higgs bosons?

- Many complementary searches with LHC Run-I data
- Both model-independent limits and model-dependent interpretations
- Significantly improved constraints on 'BSM-Higgs parameter space', e. g.
 - ▶ closing low m_A -region in MSSM

→ We don't know yet...

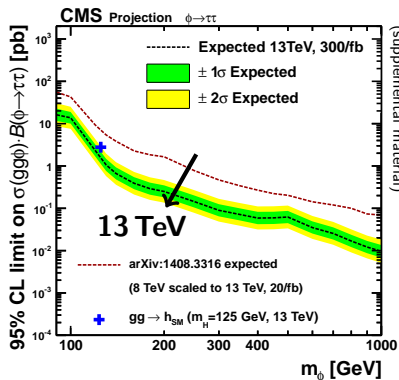

Are there any further Higgs bosons?

- Many complementary searches with LHC Run-I data
- Both model-independent limits and model-dependent interpretations
- Significantly improved constraints on 'BSM-Higgs parameter space', e. g.
 - ▶ closing low m_A -region in MSSM

→ We don't know yet...

... but 13 TeV data ahead
We might know soon!

$m_{\tau\tau}$ Reconstruction at CMS

Updated $\Phi \rightarrow \tau\tau$ Search at CMS

CMS-PAS-HIG-14-029

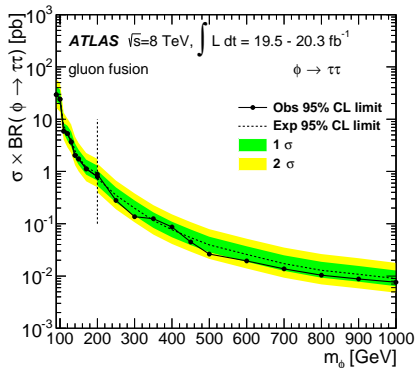

- Channels: $\mu\mu$, $e\mu$, $e\tau_h$, $\mu\tau_h$, $\tau_h\tau_h$
 - Refinements over earlier results
- 1) MVA-based identification of boosted τ_h
 - ▶ Combines isolation and lifetime information
 - ▶ 40–50% reduction of fake rate
 - 2) Further event categorization
 - ▶ Depends on $p_T(\tau_h)$

20–50% improvement in expected sensitivity for most mass points

$\Phi \rightarrow bb$: Event-B-Tag Definition

CMS-PAS-HIG-14-017 (submitted to J. High Energy Phys.)

- M_{12} templates similar for different flavour combinations
- Additional separation by SV-mass information as 2nd dimension

- \sum SV-masses (SVMS) per jet
- Combined into event-b-tag X_{123}

$$X_{123} = T_{12} + T_3$$

$$T_{12} = 0 \text{ if } B_1 + B_2 \leq 1$$

$$T_{12} = 1 \text{ if } 2 \leq B_1 + B_2 \leq 3$$

$$T_{12} = 2 \text{ if } B_1 + B_2 \geq 4$$

$$T_3 = 0 \text{ if } B_3 \leq 1$$

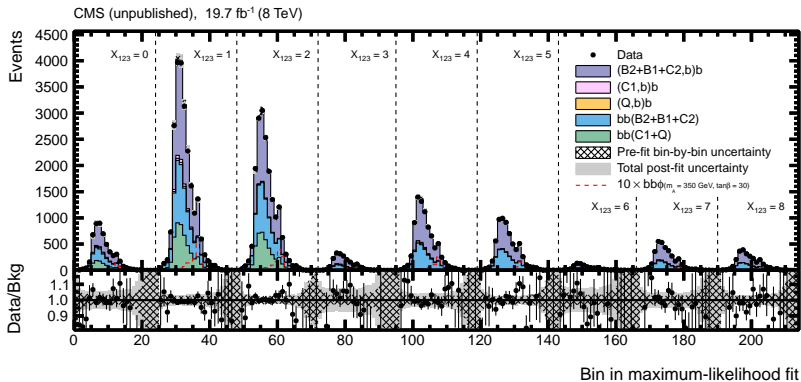

$$T_3 = 3 \text{ if } B_3 = 2$$

$$T_3 = 6 \text{ if } B_3 = 3$$

→ 9 different values by construction
