

# Higgs searches from CDF (+ combination with D0 )

New results : Low mass Higgs  
New excitement : High mass Higgs  
Some SUSY Higgs perspective

Ben Kilminster

Fermilab

CERN joint EP/PP seminar

Sept. 8, 2008

Basic theory of interactions does not provide for massive particles

# Basic theory of interactions does not provide for massive particles

## The experimental problem (1)

Hierarchy of Standard Model particle masses

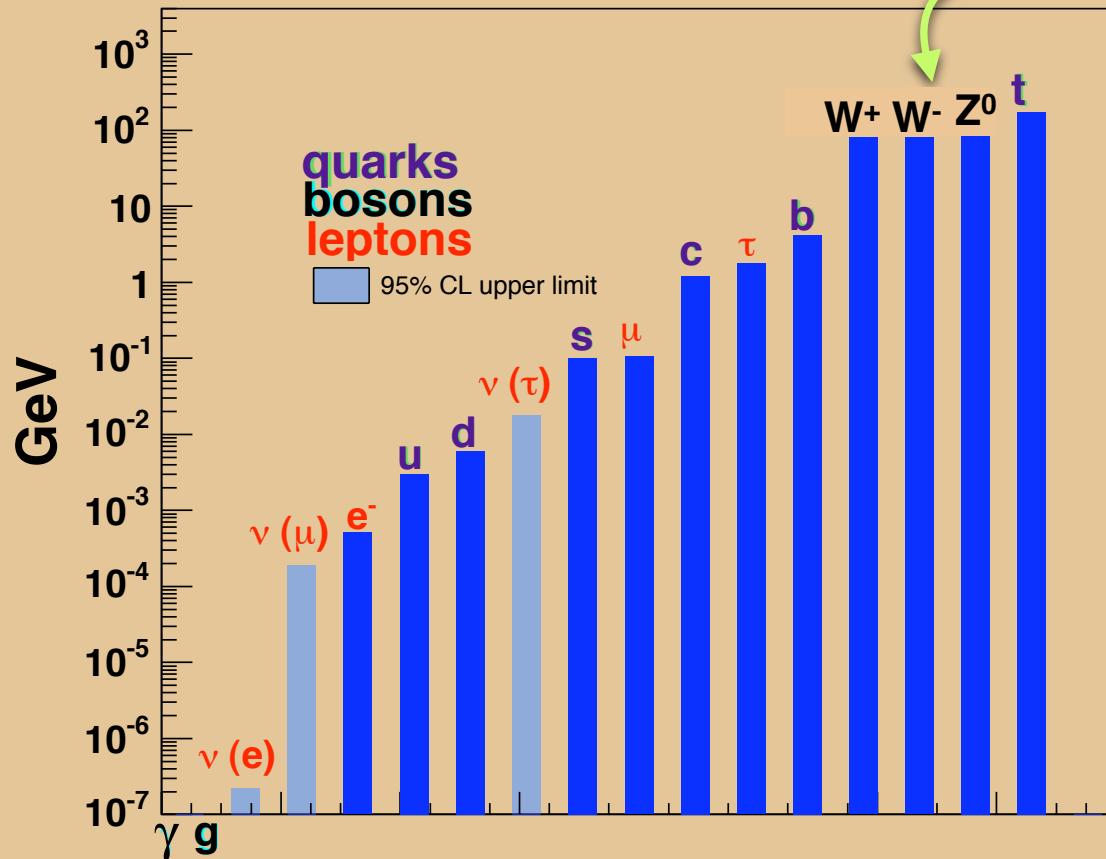

Mass everywhere !

Explicit mass terms cause Standard Model calculations to fail

# The experimental problem (2)

Hierarchy of Standard Model particle masses

Weak  
force  
carriers

EM  
force  
carrier

Fundamental asymmetry between EM and weak force carrier mass

# Solution: Higgs mechanism

## ① Add field throughout the universe

- ▶ Potential is symmetric
- ▶ Ground state breaks symmetry

## ② Cleverly

- ▶  $W$  and  $Z$  bosons gain masses through degrees of freedom of Higgs field
- ▶ Masses are generated for the fermions due to their interaction with this non-zero field
- ▶ Theory preserves *symmetry* (gauge invariance)
- ▶ Standard Model calculations no longer fail
- ▶ A new particle is predicted: the Higgs boson

## ③ Finding the Higgs boson

- ▶ Means Higgs field exists
  - Means we confirm our theory for the origin of mass

# What is the Higgs boson mass ?

- CDF and D0 may flip coins to decide talk order

# What is the Higgs boson mass ?

- CDF and D0 may flip coins to decide talk order

... but we do use a likelihood to decide where to find the Higgs boson

# What is the Higgs boson mass ?

- CDF and D0 may flip coins to decide talk order

... but we do use a likelihood to decide where to find the Higgs boson

# What is the Higgs boson mass ?

- CDF and D0 may flip coins to decide talk order

... but we do use a likelihood to decide where to find the Higgs boson

- Electroweak observables constrain Higgs boson mass within SM

# Where is the Higgs ?

Direct searches at LEP:

$$Z^* \rightarrow ZH$$

Indirect searches :

~20 measurements from  
Tevatron, LEP, SLD

# What if there is SUSY?

- One → Five Higgs bosons
- Are Tevatron SM Higgs searches still useful?
  - Consider CMSSM fits
    - Electroweak constraints
    - Anomalous magnetic moment ( $g - 2$ )
    - Cosmology - relic neutralino abundance
    - Rare B decays
  - MSSM predicts a SM-like Higgs
    - $113 < m_H < 122$  GeV @ 95% region
  - $H^\pm, H^0, A^0$ 
    - $0.2$  TeV  $< m < 3.6$  TeV @ 95% region
    - Likely out of reach for Tevatron

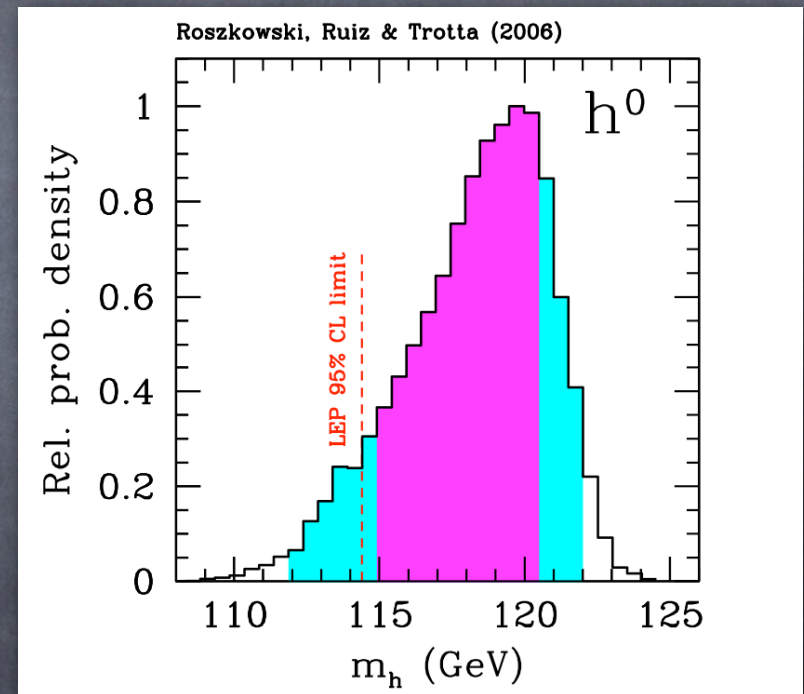

JHEP 0704:084,2007

# What if there is SUSY?

- One → Five Higgs bosons
- Are Tevatron SM Higgs searches still useful ?
  - ▶ Consider CMSSM fits
    - > Electroweak constraints
    - > Anomalous magnetic moment ( $g - 2$ )
    - > Cosmology - relic neutralino abundance
    - > Rare B decays
  - ▶ MSSM predicts a SM-like Higgs
    - $113 < m_H < 122$  GeV @ 95% region
  - ▶  $H^\pm, H^0, A^0$ 
    - $0.2$  TeV  $< m < 3.6$  TeV @ 95% region
    - Likely out of reach for Tevatron

JHEP 0704:084,2007

- Low mass SM Higgs searches may be first indication of MSSM
  - ▶ Though we wouldn't know it from SM until LHC finds the others !

# CDF Higgs storyline

- How to build an advanced Higgs analysis program
  - ▶ Start with **basic analysis**
  - ▶ Bootstrap special techniques to **gain sensitivity**
    - **Improve acceptance**
      - > Loosen lepton ID & b-tag requirements
      - > Add backup triggers
      - > Relax kinematic selection
    - But... backgrounds increase & become more difficult to model
      - > Incorporate specialized **background rejection** techniques
      - > **Background modeling** checks ! Data must stay well modeled !
      - > Separate out events into categories with better  $S/\sqrt{B}$ 
        - **High  $S/\sqrt{B}$**  gives best signal sensitivity
        - **Low  $S/\sqrt{B}$**  gives best background constraints
      - > Use **multivariate techniques** to distinguish signal events
- **Repeat** for every Higgs discovery mode
- **Combine** taking into account uncertainties correlated between correlated backgrounds

# ZH $\rightarrow$ llbb story

for  $m_H < 135$

- Smallest expected signal

- ▶ Small  $\sigma_{ZH}$  and  $BR(Z \rightarrow ll)$

- But, fully constrained = lower backgrounds

- ▶ Two resonances  $H \rightarrow bb$  and  $Z \rightarrow ll$

- Baseline analysis

- ▶ Start with inclusive high  $P_T$  lepton trigger ( $Track + E_T > 18$  GeV)
- ▶ Select two leptons  $E_T > 18, 10$  GeV,  $\geq 2$  jets  $E_T > 20, 15$  GeV
- ▶ Fit dijet mass for an excess from  $H \rightarrow bb$

# ZH $\rightarrow$ llbb story

for  $m_H < 135$

## Smallest expected signal

- ▶ Small  $\sigma_{ZH}$  and  $BR(Z \rightarrow ll)$

## But, fully constrained = lower backgrounds

- ▶ Two resonances  $H \rightarrow bb$  and  $Z \rightarrow ll$

## Baseline analysis

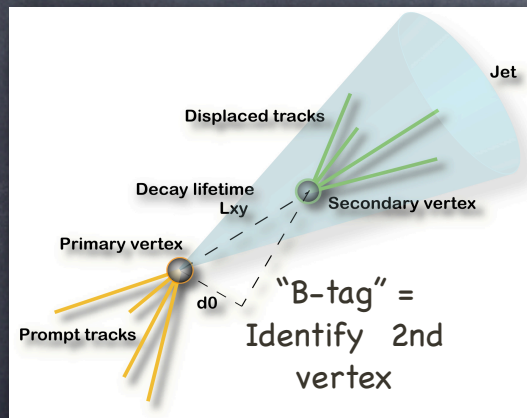

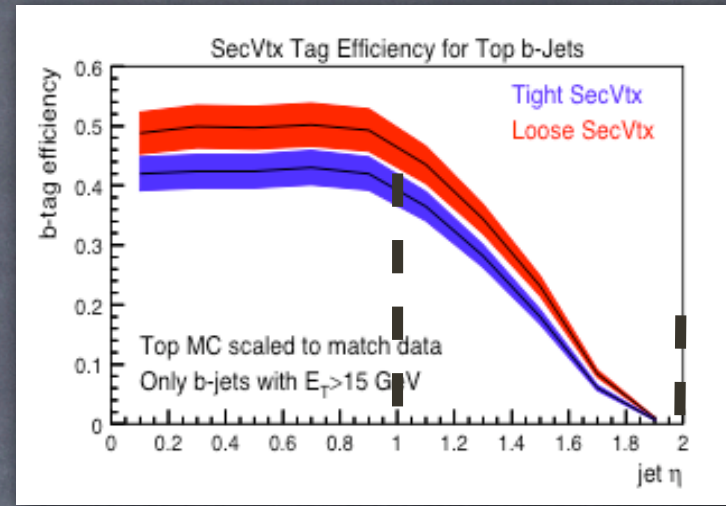

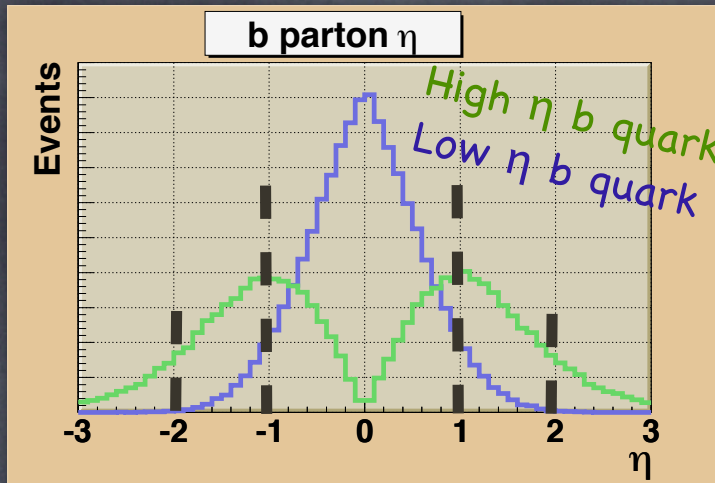

- ▶ Start with inclusive high  $P_T$  lepton trigger ( $Track + E_T > 18$  GeV)
- ▶ Select two leptons  $E_T > 18, 10$  GeV,  $\geq 2$  jets  $E_T > 20, 15$  GeV
- ▶ Fit dijet mass for an excess from  $H \rightarrow bb$

## Special techniques

- ▶ Relax lepton requirements
  - Second muon does not require muon chamber confirmation
  - Second electron does not require track when forward in  $\eta$
  - **New: Dilepton categories from "no-track" trigger : two energy deposits in central or forward region**
- ▶ Use b-tagging to improve  $S/\sqrt{B}$
- ▶ Improve dijet mass resolution
- ▶ Employ Artificial Neural Network for improved separation

# B-tagging in $ZH \rightarrow llbb$

# B-tagging in $ZH \rightarrow llbb$

Divide into subsets and win  
(ZH expectations shown here for  $2.4 \text{ fb}^{-1}$ )

Category	S	B	S/sqrt(B)
High - 2 Loose b-tags	0.5	30	0.09
High - 1 Tight b-tag	0.9	200	0.06
Low - 2 Loose b-tags	0.1	7	0.04
Low - 1 Tight b-tag	0.1	70	0.01
Sum in quadrature of S/sqrt(B) (scales like 1 / Limit)			0.09 $\rightarrow$ 0.12

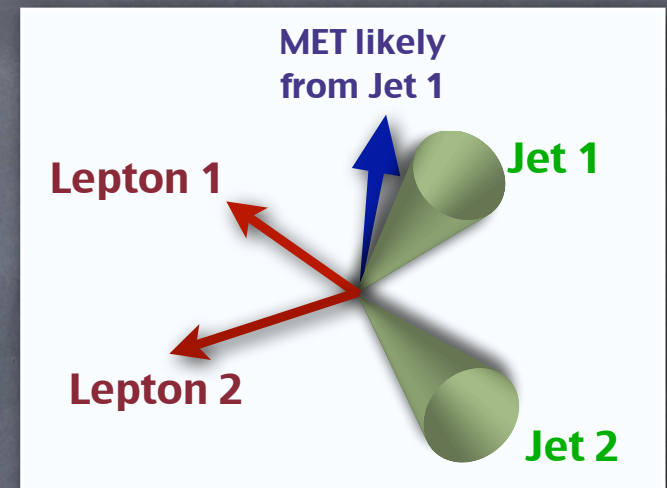

Dilepton categories

- “High” central Z purity
- “Low” central Z purity

# $ZH \rightarrow llbb$

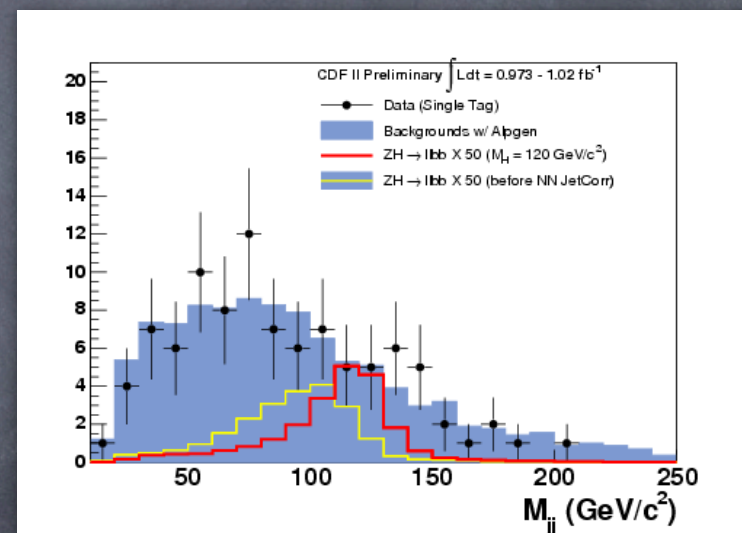

- Can improve  $M_{jj}$  resolution by correcting jets according to projection onto MET direction

# ZH $\rightarrow$ llbb

- Can improve  $M_{jj}$  resolution by correcting jets according to projection onto MET direction

- For events w/ two b-tags, dijet mass resolution improves from 18% to 11%

# Multivariate techniques

- Multivariate analysis techniques
  - ▶ Used in all CDF Higgs analyses
- Functions which transform multiple inputs into single discriminant tuned for identifying a single process
  - ▶ NN = Neural Net
  - ▶ ME = Matrix Element
  - ▶ BDT = Boosted Decision Trees
- Validation
  - ▶ Inputs must be modeled correctly
  - ▶ Correlations of inputs and output discriminant tested vigorously in independent control samples with similar kinematics and backgrounds

# Multivariate techniques

## Multivariate analysis techniques

▶ Used in all CDF Higgs analyses

Functions which transform multiple inputs into single discriminant tuned for identifying a single process

▶ NN = Neural Net

▶ ME = Matrix Element

▶ BDT = Boosted Decision Trees

## Validation

▶ Inputs must be modeled correctly

▶ Correlations of inputs and output discriminant tested vigorously in independent control samples with similar kinematics and backgrounds

## Pre b-tag NN Output for ZH

▶ Same object kinematics

▶ Statistics = 30 \* tagged sample

▶ NN trained on :

▶ Masses of combinations (j1, j2, e/μ)

▶ P<sub>T</sub> of combinations

▶ Angular separations

# ZH $\rightarrow$ llbb

Have also done ME analysis with 2.1 fb<sup>-1</sup>  
In the process of merging the two ...

$\mathcal{L} = 2.4 \text{ fb}^{-1}, m_H = 115 \text{ GeV}$   
Upper limit: 11.8\*SM  
(expected 11.6\*SM)

**World's best exp. limit in this channel !**

# WH $\rightarrow$ lvbb: the golden channel for $m_H < 135$

- Selection ( $l + \text{MET} + \geq 2 \text{ jets} + \geq 1 \text{ b-tag}$ )
  - one lepton, e or  $\mu$ ,  $P_T > 20 \text{ GeV}$
  - MET = Missing transverse energy  $> 20 \text{ GeV}$
  - $\geq 2$  jets from bs,  $E_T > 15 \text{ GeV}$
  - Require jet to be b-tagged

- Lots of Tevatron experience

- ▶ Same as single top - CDF had 2006 evidence
- ▶ Similar to golden analysis for studying top quark pairs
  - $l + \text{MET} + \geq 4 \text{ jets} + \text{b-tag}$

- Basic analysis

- Use central high  $P_T$  lepton trigger
- Search for resonance in dijet mass

# WH → lvbb

## Improving lepton acceptance

### Forward (plug) electrons

- Plug electron trigger rate is too high since we have little tracking to reject jets
- Use plug electron + MET trigger

### New: Incomplete muons

- Central muon trigger requirements are stringent because trigger rate is high
- Use jets + MET trigger
- Select muons offline with looser criteria

Dijet mass in plug WH candidates

New events passing "isolated track" lepton requirements

# WH $\rightarrow$ $lvbb$ results

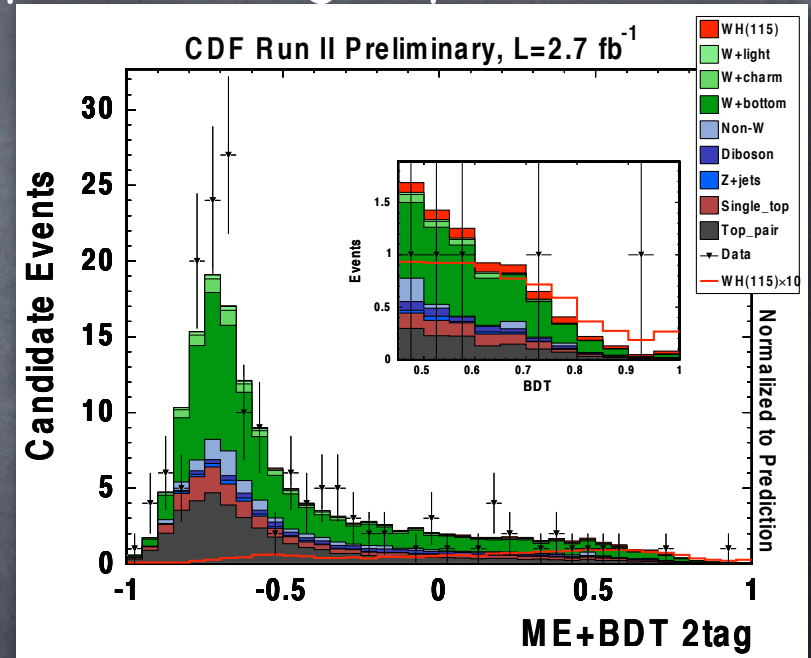

- ▶ Several iterations to optimize NN analysis

- ▶ Newer parallel effort with matrix elements (from single-top evidence group)

Uses 2 b-tagging categories for final result (this is one)

# WH $\rightarrow$ $lvbb$ results

- Several iterations to optimize NN analysis

- Newer parallel effort with matrix elements (from single-top evidence group)

Uses 2 b-tagging categories for final result (this is one)

$\mathcal{L} = 2.7 \text{ fb}^{-1}$ ,  $m_H = 115 \text{ GeV}$   
Upper limit:  $5.0 \cdot \text{SM}$   
(expected  $5.8 \cdot \text{SM}$ )

$\mathcal{L} = 2.7 \text{ fb}^{-1}$ ,  $m_H = 115 \text{ GeV}$   
Upper limit:  $5.8 \cdot \text{SM}$   
(expected  $5.6 \cdot \text{SM}$ )

# VH $\rightarrow$ MET+jets

## Using tracking in 2 ways

- ▶ Tracks have excellent momentum resolution
- ▶ 2/3 of particles in jets are charged

## Missing $P_T$ of tracks = TMET

- ▶ Provides confirmation of high MET measured in calorimeter
- ▶ Helpful for reducing QCD

## Improving jet resolution

- ▶ H1 algorithm
  - New : 1st time in CDF analysis
- ▶ Correct calorimeter towers with matched higher  $P_T$  tracks

# VH $\rightarrow$ MET+jets result

## First stage NN

- ▶ Trained to remove QCD

## Cut here

- ◉ Removes 65% of Multijet
- ◉ Removes only 5% of signal

# VH $\rightarrow$ MET+jets result

## First stage NN

- ▶ Trained to remove QCD

## Second stage NN

- ▶ Removes W/Z+jets and top

Uses 3 b-tagging categories for final result (this is one)

## Cut here

- ◉ Removes 65% of Multijet
- ◉ Removes only 5% of signal

# VH $\rightarrow$ MET+jets result

## First stage NN

- Trained to remove QCD

## Cut here

# CDF Combination

- Low and high mass Higgs channels combined for CDF

Channel	Limit @ 115 GeV
WH	5 (6)
VH → MET+bb	8 (6)
ZH → llbb	12 (12)
H → ττ + jets	26 (30)

# CDF Combination

- Low and high mass Higgs channels combined for CDF

Channel	Limit @ 115 GeV
WH	5 (6)
VH $\rightarrow$ MET+bb	8 (6)
ZH $\rightarrow llbb$	12 (12)
H $\rightarrow \tau\tau$ + jets	26 (30)

CDF combined upper limits:  
 $m_H = 115$  GeV 3.6\*SM expected  
 $m_H = 165$  GeV 1.6\*SM expected

# CDF results - Past and Future

- For  $m_H = 160$  GeV
  - ▶ Baseline analysis (2004) would require  $36 \text{ fb}^{-1}$  for  $2\sigma$  sensitivity
  - ▶ Advanced analysis now sensitive with  $< 5 \text{ fb}^{-1}$
  - ▶ CDF only limit is  $1.6 \times \text{SM}$
  - ▶ Goal is bottom of yellow band
  - ▶ Expect to exclude significant region around  $m_H = 160$  GeV with more data

CDF Run II Preliminary,  $m_H = 160$  GeV

# CDF results - Past and Future

## For $m_H = 160$ GeV

- ▶ Baseline analysis (2004) would require  $36 \text{ fb}^{-1}$  for  $2\sigma$  sensitivity
- ▶ Advanced analysis now sensitive with  $< 5 \text{ fb}^{-1}$
- ▶ CDF only limit is  $1.6 \times \text{SM}$
- ▶ Goal is bottom of yellow band
- ▶ Expect to exclude significant region around  $m_H = 160$  GeV with more data

## For $m_H = 115$ GeV

- ▶ Ongoing improvements
  - B-tagging
  - Lepton acceptance
  - Jet / Met resolution
  - Complementary triggers
  - Signal/Bkg separation techniques
- ▶ Nearing yellow band steadily

CDF Run II Preliminary,  $m_H = 160$  GeV

CDF Run II Preliminary,  $m_H = 160$  GeV

CDF Run II Preliminary,  $m_H = 115$  GeV

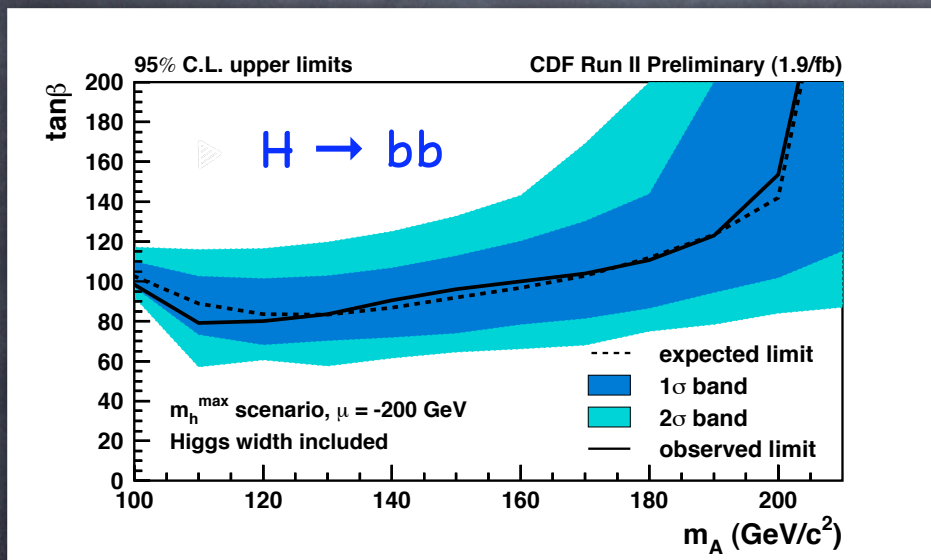

# More on SUSY

## • If SUSY is the correct theory

- ▶ Some Higgs production mechanisms enhanced by  $(\tan \beta)^2$
- ▶ Direct  $gg \rightarrow H \rightarrow bb$  and  $H \rightarrow \tau\tau$  modes become viable searches for neutral SUSY Higgs mass  $< \sim 200$  GeV

## • Between CDF and D0

- ▶  $H \rightarrow bb$ ,  $H \rightarrow \tau\tau$ ,  $H \rightarrow \tau\tau + b$
- ▶ Will have 6 channels with comparable sensitivity
- ▶ Plan to combine for MSSM  $\tan \beta$  limits

# CDF Conclusions

## 👁 Searching for every available Higgs boson

### 👁 Low mass Higgs

- ▶ World's best limits in  $ZH \rightarrow llbb$ ,  $WH \rightarrow lvbb$ ,  $VH \rightarrow MET+bb$ 
  - Additional all-jets and  $\tau\tau$  modes improve total sensitivity
- ▶ Combined limit 3.6 \* SM expected with 3  $fb^{-1}$
- ▶ Steady improvements since 2005
  - Near sensitivity for low mass exclusion with full dataset & D0

### 👁 High mass Higgs

- ▶ World's best limits in  $H \rightarrow WW$
- ▶ 1.6 \* SM expected with 3  $fb^{-1}$
- ▶ Goal is single-experiment exclusion for range of masses

### 👁 MSSM Higgs

- ▶ Low mass  $ZH/WH$  Higgs searches may be best way to find CMSSM
- ▶ SUSY searches for  $H \rightarrow bb$  and  $H \rightarrow \tau\tau$  extend limits on  $\tan \beta$

# CDF + D0 Combination

- We use two different methods (done by different people on different experiments) to verify accuracy
  - ▶ Method 1 : CLs
  - ▶ Method 2 : Bayesian - expected to be more conservative (coverage is greater than 95%)

# CDF + D0 Combination

- We use two different methods (done by different people on different experiments) to verify accuracy
  - ▶ Method 1 : CLs
  - ▶ Method 2 : Bayesian - expected to be more conservative (coverage is greater than 95%)

# Combination with D0

## CLs combination plot

95%CL Limits/SM				
M Higgs(GeV)	160	165	<b>170</b>	175

Method 2: Obs	1.3	1.1	<b>0.95</b>	1.2

# Combination with D0

## CLs combination plot

95%CL Limits/SM				
M Higgs(GeV)	160	165	<b>170</b>	175
Method 1: Exp	1.3	1.2	1.4	1.7
Method 1: Obs	1.4	1.2	<b>1.0</b>	1.3
Method 2: Exp	1.2	1.1	1.3	1.7
Method 2: Obs	1.3	1.1	<b>0.95</b>	1.2

Results are consistent :  
 $m_H$  at 170 GeV ruled out at 95% CL

# CDF + D0 Conclusions

## 👁 Searching for every available Higgs boson

- ▶ Using up to  $3 \text{ fb}^{-1}$  of data per experiment
  - Current full dataset is  $\sim 4 \text{ fb}^{-1}$
  - **Expect 6 - 8  $\text{fb}^{-1}$  total per experiment**

## 👁 MSSM Higgs

- ▶ Low mass ZH/WH Higgs searches may be best way to find CMSSM
- ▶ SUSY searches for  $H \rightarrow bb$  and  $H \rightarrow \tau\tau$  extend limits on  $\tan \beta$

## 👁 Low mass Higgs

- ▶ Steady improvements since 2005
  - Near sensitivity for low mass exclusion with full dataset & D0

## 👁 High mass Higgs

- ▶ Excluded  $m_H$  at 170 GeV !!
- ▶ Goal is combined exclusion for wide range of high mass Higgs

Backups
