

Sensory and imaging technology in science, health and security

Andrea Cuomo

Executive Vice President, Advanced Systems Technology and Special Projects,
STMicroelectronics

Semiconductors are pervasive in our Lives 2

Every day, we use several hundred electronic devices before arriving at the office

Semiconductors are pervasive in our Lives

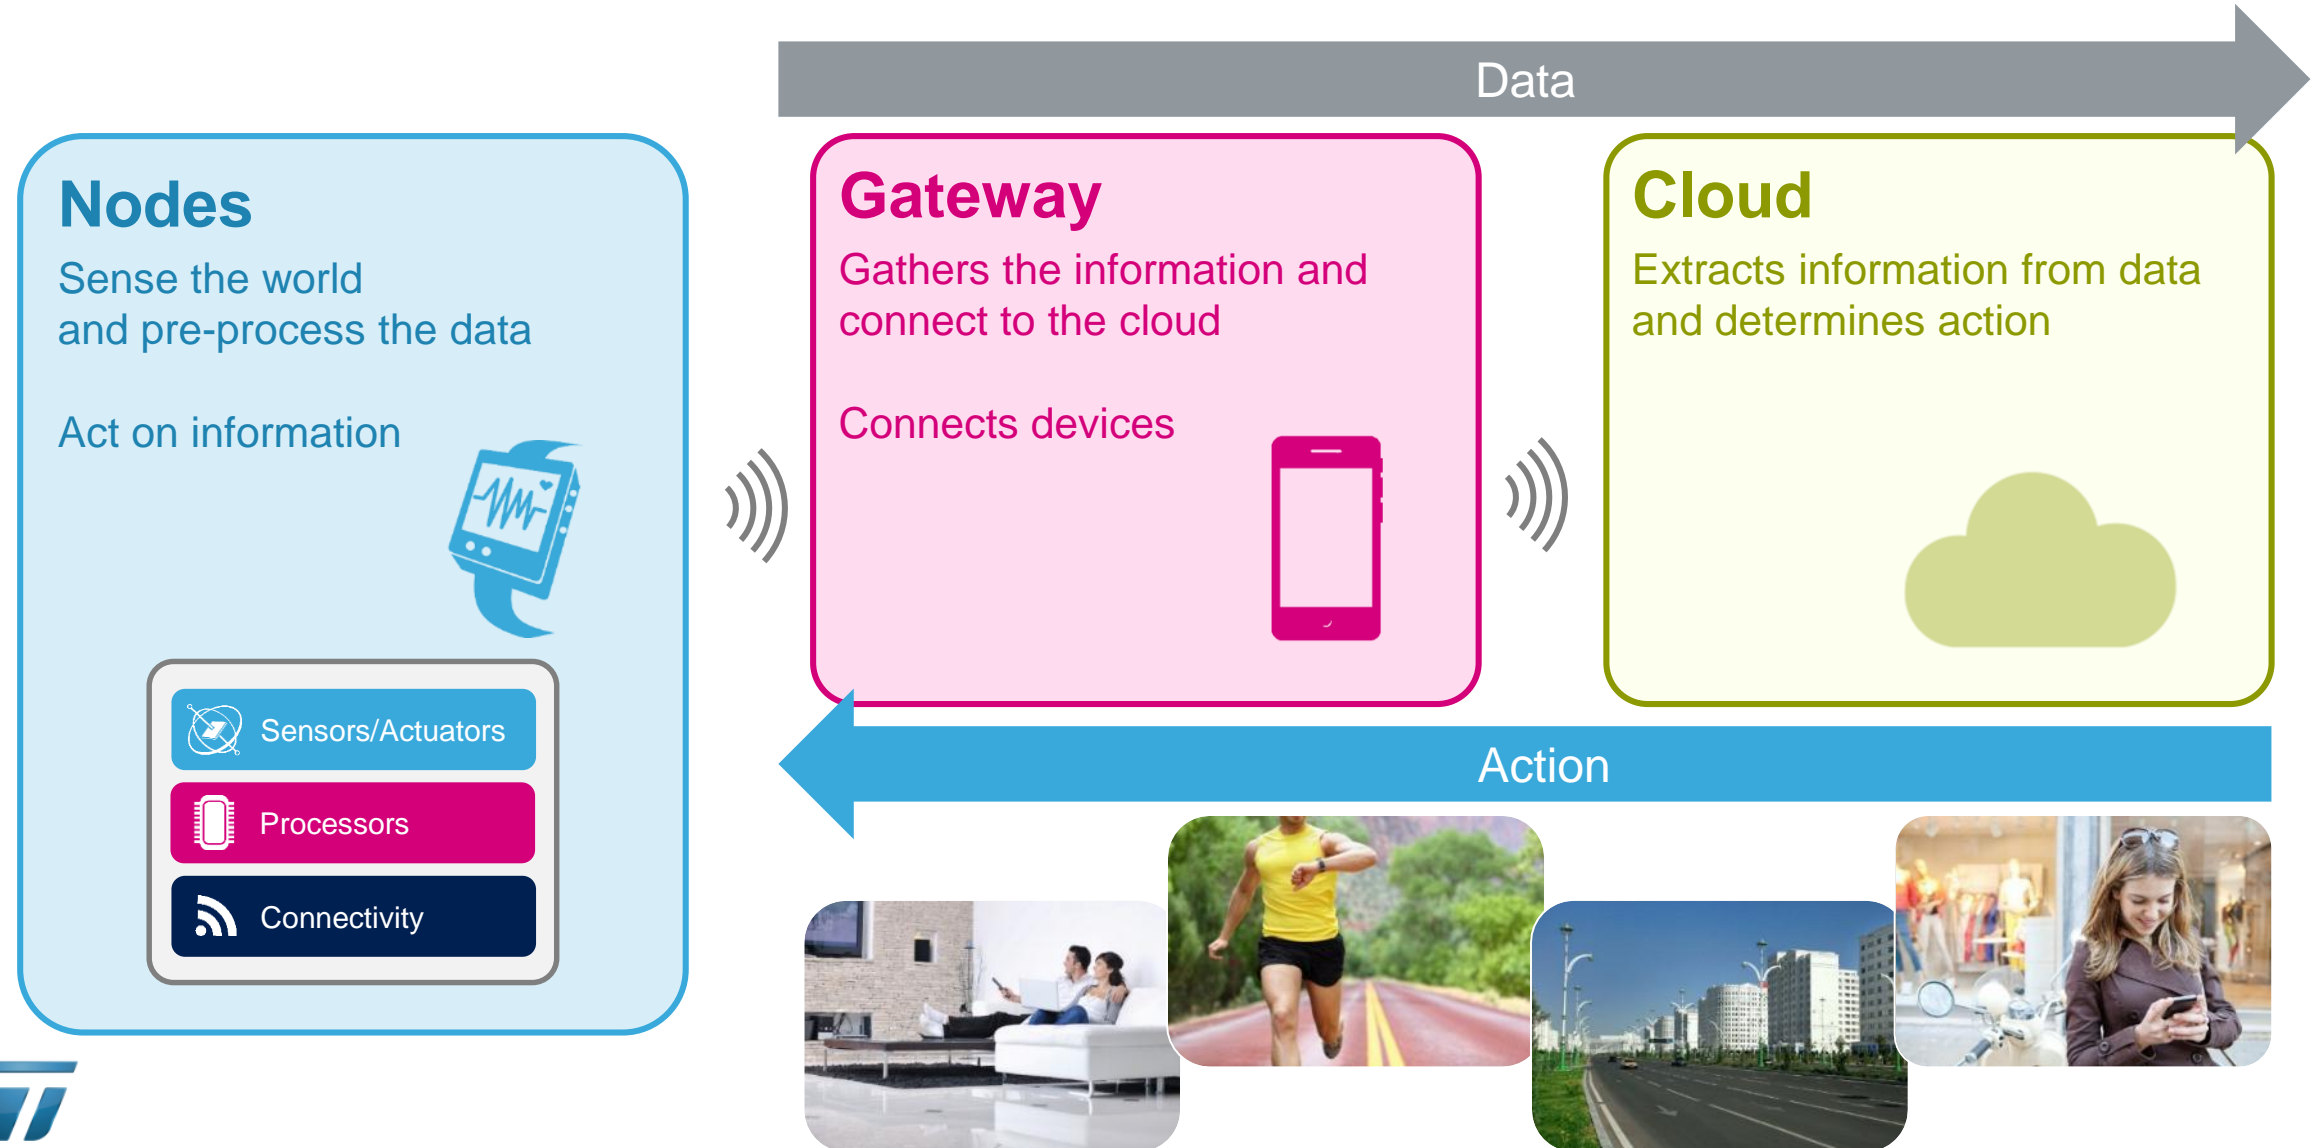

3

Then there is the part we cannot see...
with electronics everywhere to manage all the devices of our daily lives

A three step end-to-end Process

4

Sensors: An essential Part of the System 5

Collect data from the environment to build an accurate picture of the world

- Sensors are based on many different technologies
- Silicon sensors seen explosive growth
 - quickly scale in mass production
 - perfect reproducibility of each device
 - economies of scale

Products driving MEMS Adoption

6

Game controllers

Input devices
Remote controls

Portable Devices

Cameras

Notebook PCs

Automotive

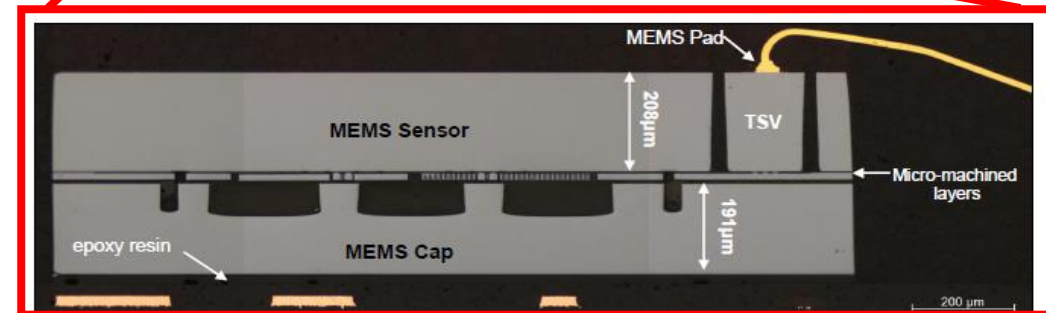

- Vehicle control
- Front light inclination
- Assisted GPS navigation
- Roll over detection
- Collision detection
- Antitheft
- Collision reconstruction

MEMS: The beating Heart 7

Motion MEMS Sensor
Micro-machines layers

Structure of a Micro-Electro-Mechanical System

We started 23 years ago with an Inkjet Printer

8

Buried channels for disposable Ink-jet printers

Buried channels for PCR
In a disposable lab-on-chip

Healthcare is the next Driver

9

Sensors for Healthcare

10

Towards
personalized
healthcare

Gas sensors

For **asthma prevention** (air quality, pollen count)

Inertial modules

For activity monitoring in **Alzheimer, obesity, sleep disorders**

Pressure sensor

In the eye for **Glaucoma diagnostic**

Chemical sensors & analog

For **blood analysis and ECG**

Actuators

Glucose monitoring & Insulin nano pump for **diabetics**

Nanopump developed by Debiotech with ST for diabetes management

Contact Lens for non-invasive early diagnosis and personalized treatment of Glaucoma

- Sensor is a strain gauge & antenna embedded in a silicon contact lens
- The sensor is capable of measuring cornea deformations due to Intra-Ocular-Pressure (IOP) variations
- The IOP Sensor is a wireless sensor that acts as a transducer, antenna and mechanical support for additional read-out electronics

ST wafer containing lens sensors

Implanting Silicon is not new

13

 **BIOTRONIK**

Medtronic

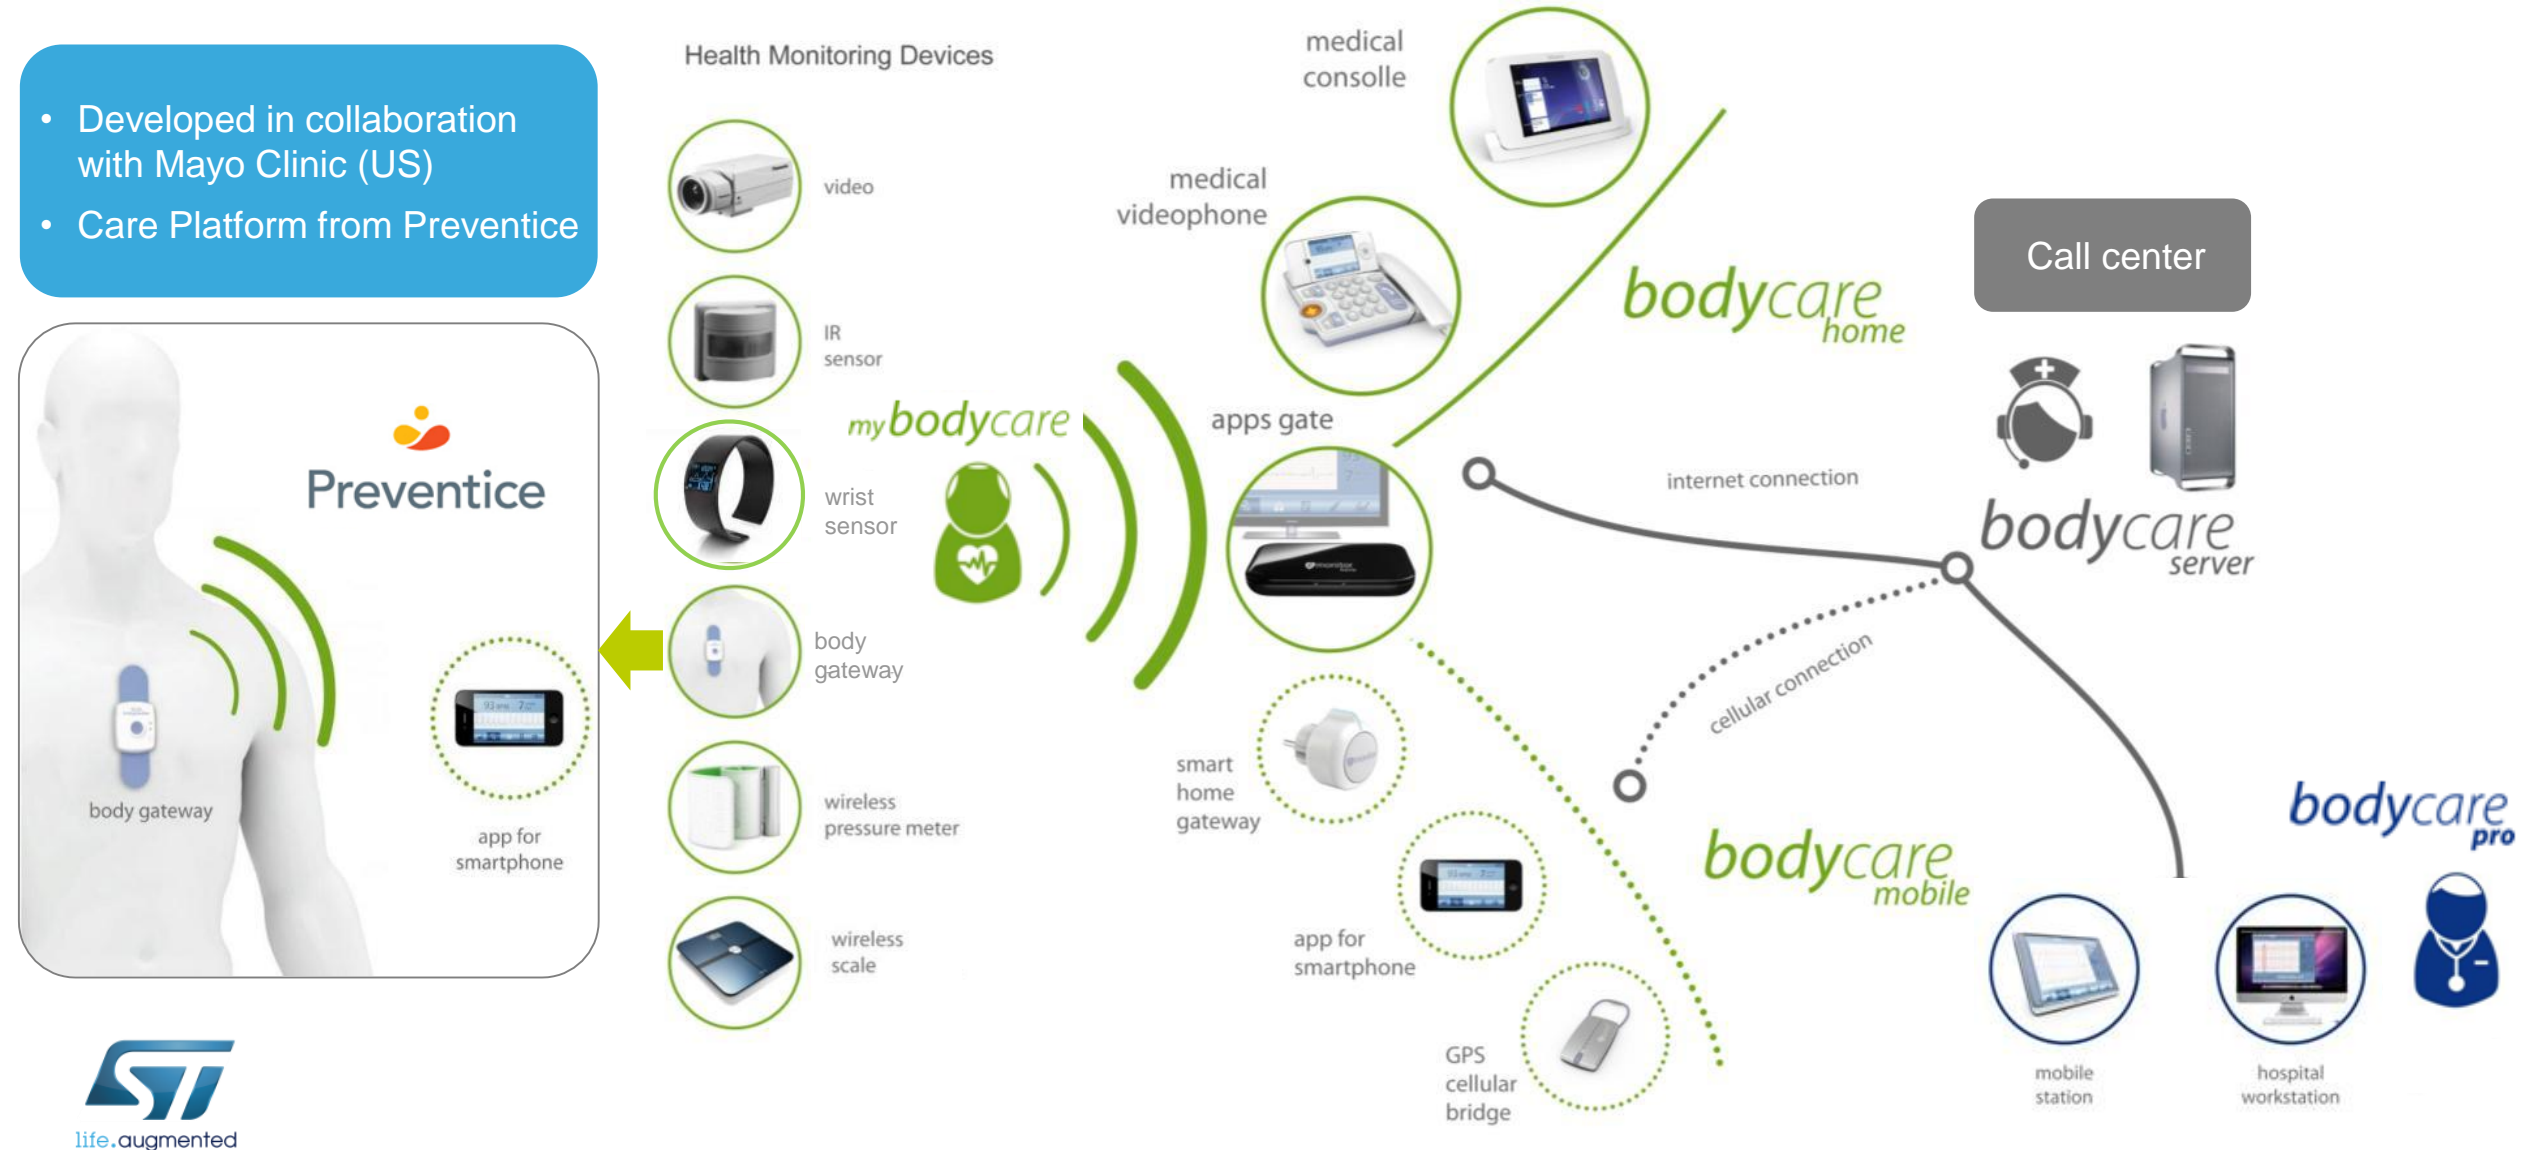

**Boston
Scientific**
Advancing science for life™

 **ST. JUDE MEDICAL™**

The Real Innovation is the Connectivity

14

- Developed in collaboration with Mayo Clinic (US)
- Care Platform from Preventice

But this is just the Beginning

Example of BioToBit real time PCR* platform

15

Identification of multiple analyses of specific nucleic acids (DNA, RNA) sequences

Today

upper external case
optical support mask
optical module
pivot and springs
cartridge holder
lower external case
push-button for Q3
Reader opening

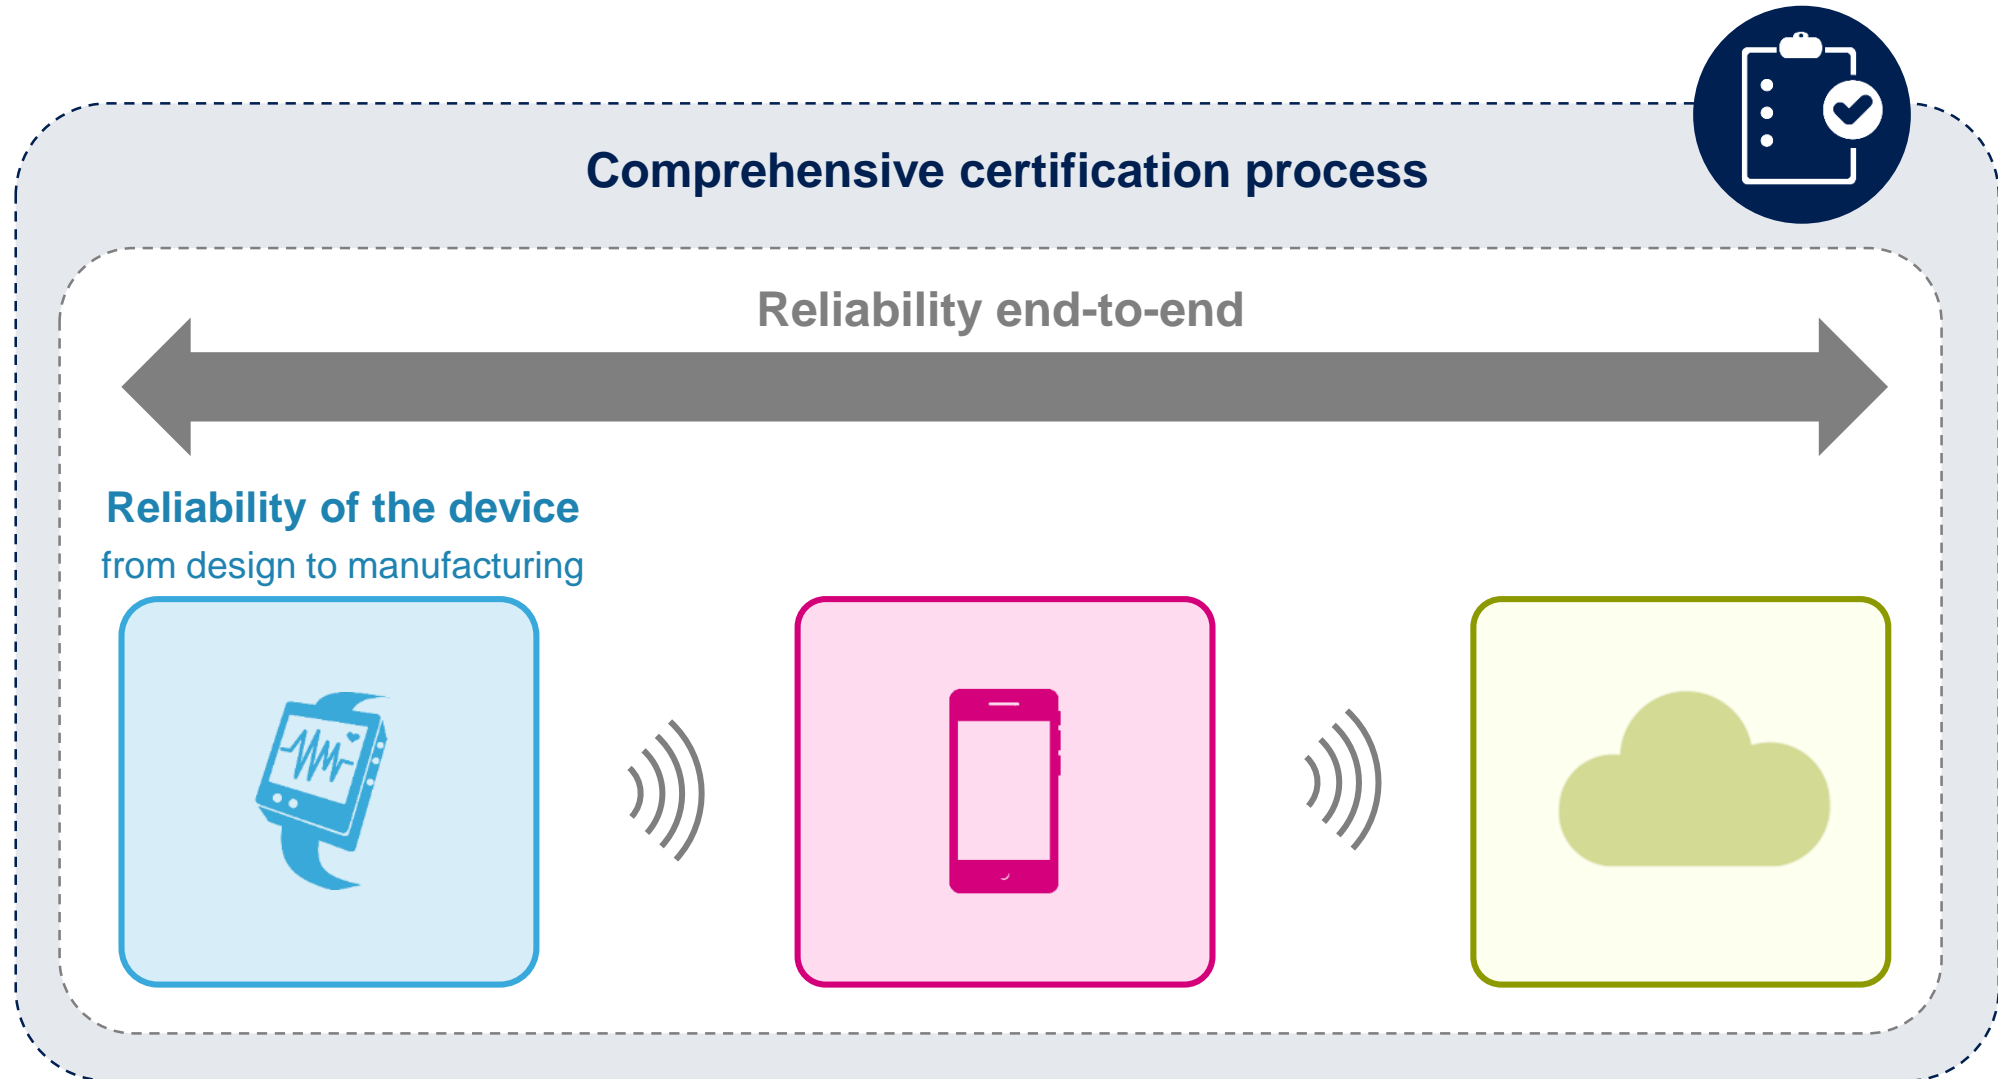

Next Year

*Real time Polymerase Chain Reaction (PCR) amplification

What's different in Healthcare

16

The importance of the cloud

17

Zetabytes of data collected every year

Filtered and analyzed to provide valuable information

From analytics towards cognitive computing

Analytics, an Example

18

“Normal subjects”

Psilocybin (psychoactive drug)
treated subjects

What is cognitive Computing

19

Huge computing power required to operate

Cognitive Computing

Example of IBM Watson

20

- Operates at 80 teraflops. The human brain is estimated to have a processing power of 100 teraflops (100 trillion operations per second).
- Has the equivalent in memory (RAM) that the Library of Congress adds in books and media over a 4 month period
- Can process 200 million times more instructions per second than the Space Shuttle's computers
- Parses within 3 seconds the equivalent of the number of books on a 700 yard long book shelf...and picks out the relevant information, and create an answer.

Security is key

21

Our lives are increasingly dependent on data

Security ↔ Safety

22

ST Know-how in Security

23

Wide offering in Secure microcontrollers, including Secure Elements, NFC transceivers and java cards

Availability of cryptographic HW support in connectivity devices (STarGrid, STComet, SPIRIT1)

#1 WW supplier in Secure Element (SIM form factor or Embedded)

Leader in PAY-TV SIM card

Vast support of cryptography in HW and SW for STM32

Inventor of Keccak algorithm adopted by US NIS for new SHA-3 hash standard

Flash protection mechanism and pre-integration of SW stacks

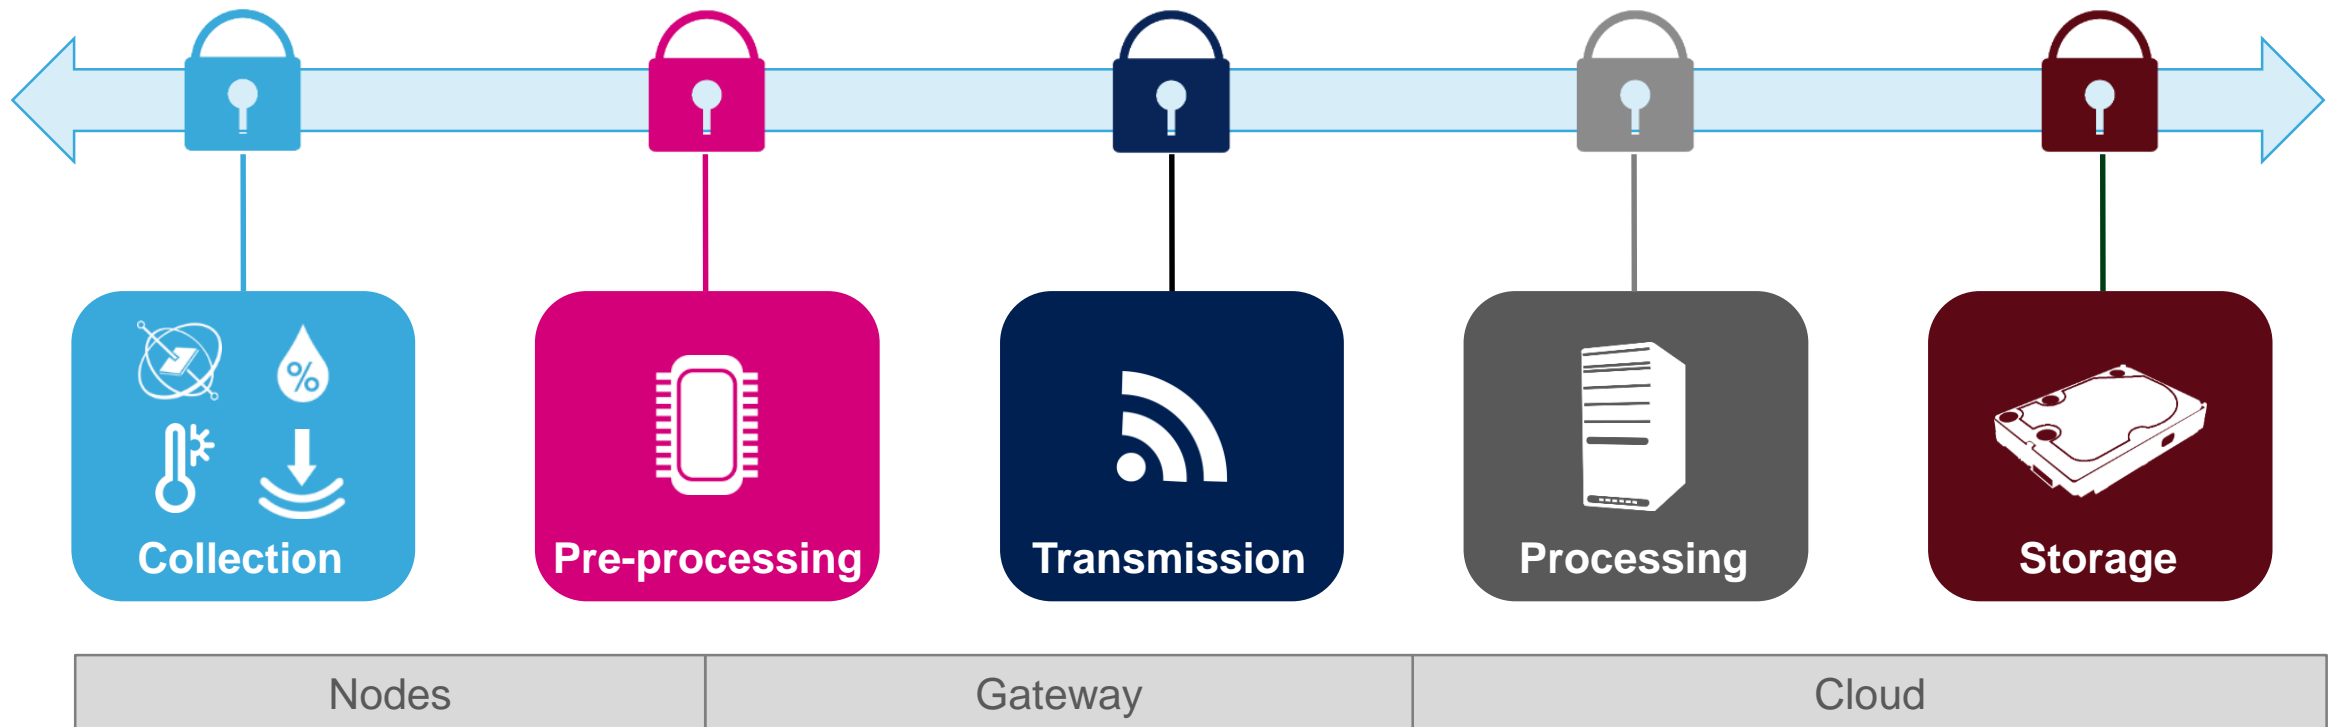

Strong ecosystem: Conditional Access, Digital Rights Management, new crypto technologies, watermarking

Certified HW & SW solutions

End-to-end security

24

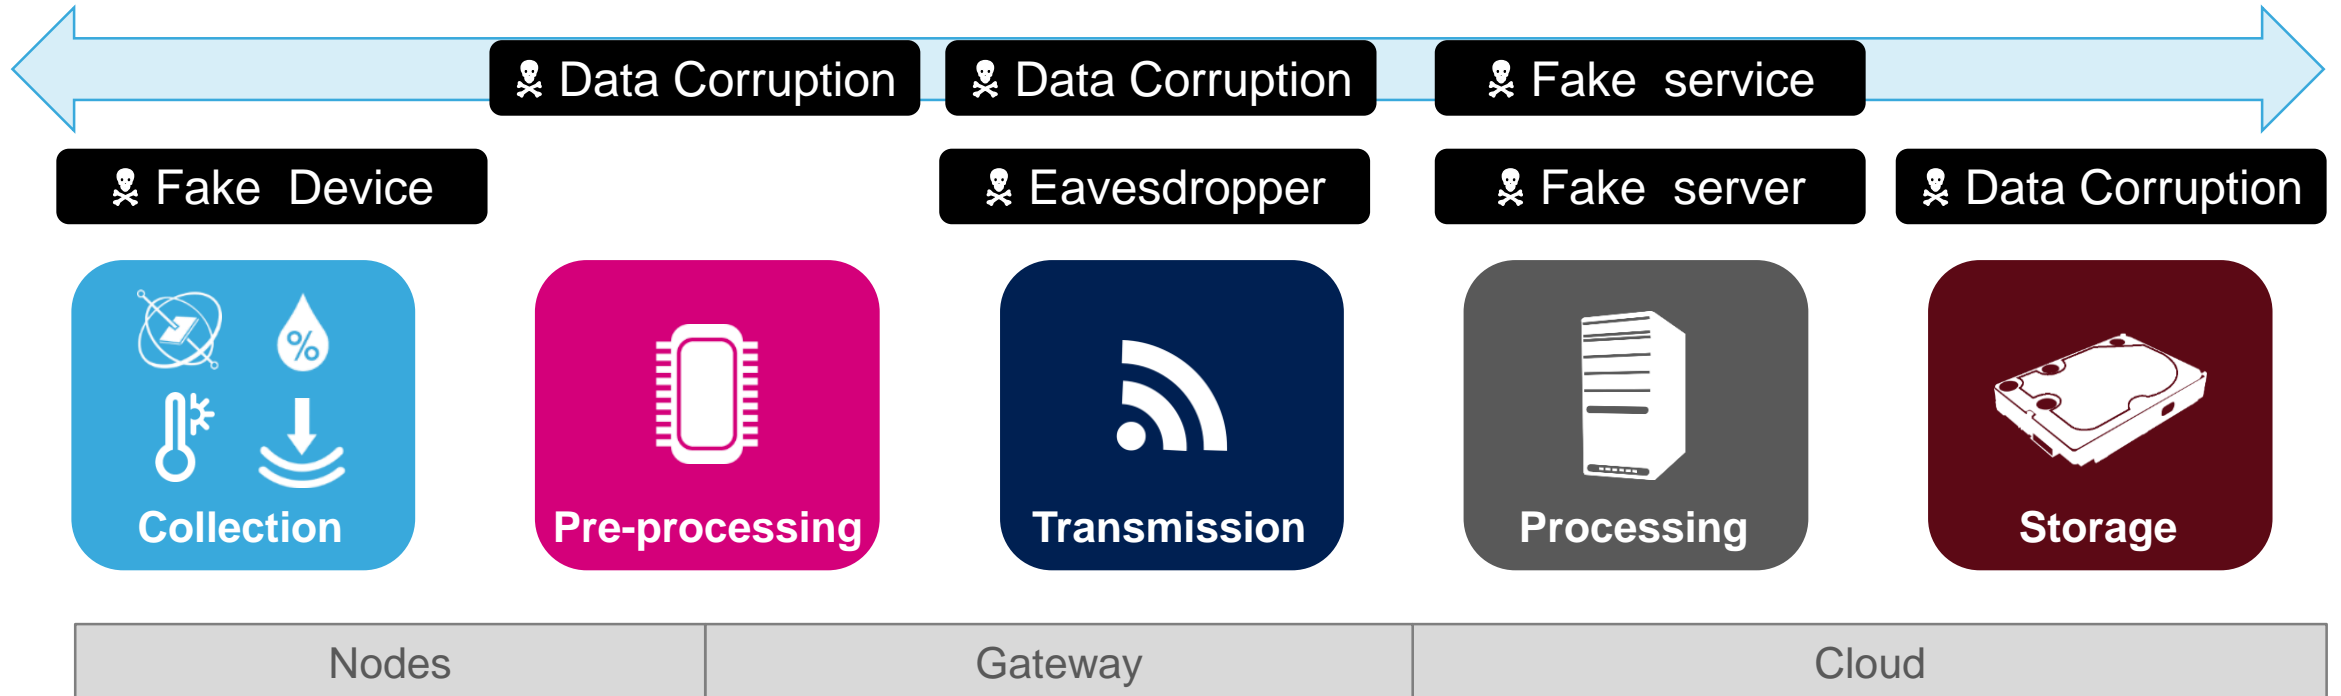

Importance of security throughout the whole chain

Threats to Data

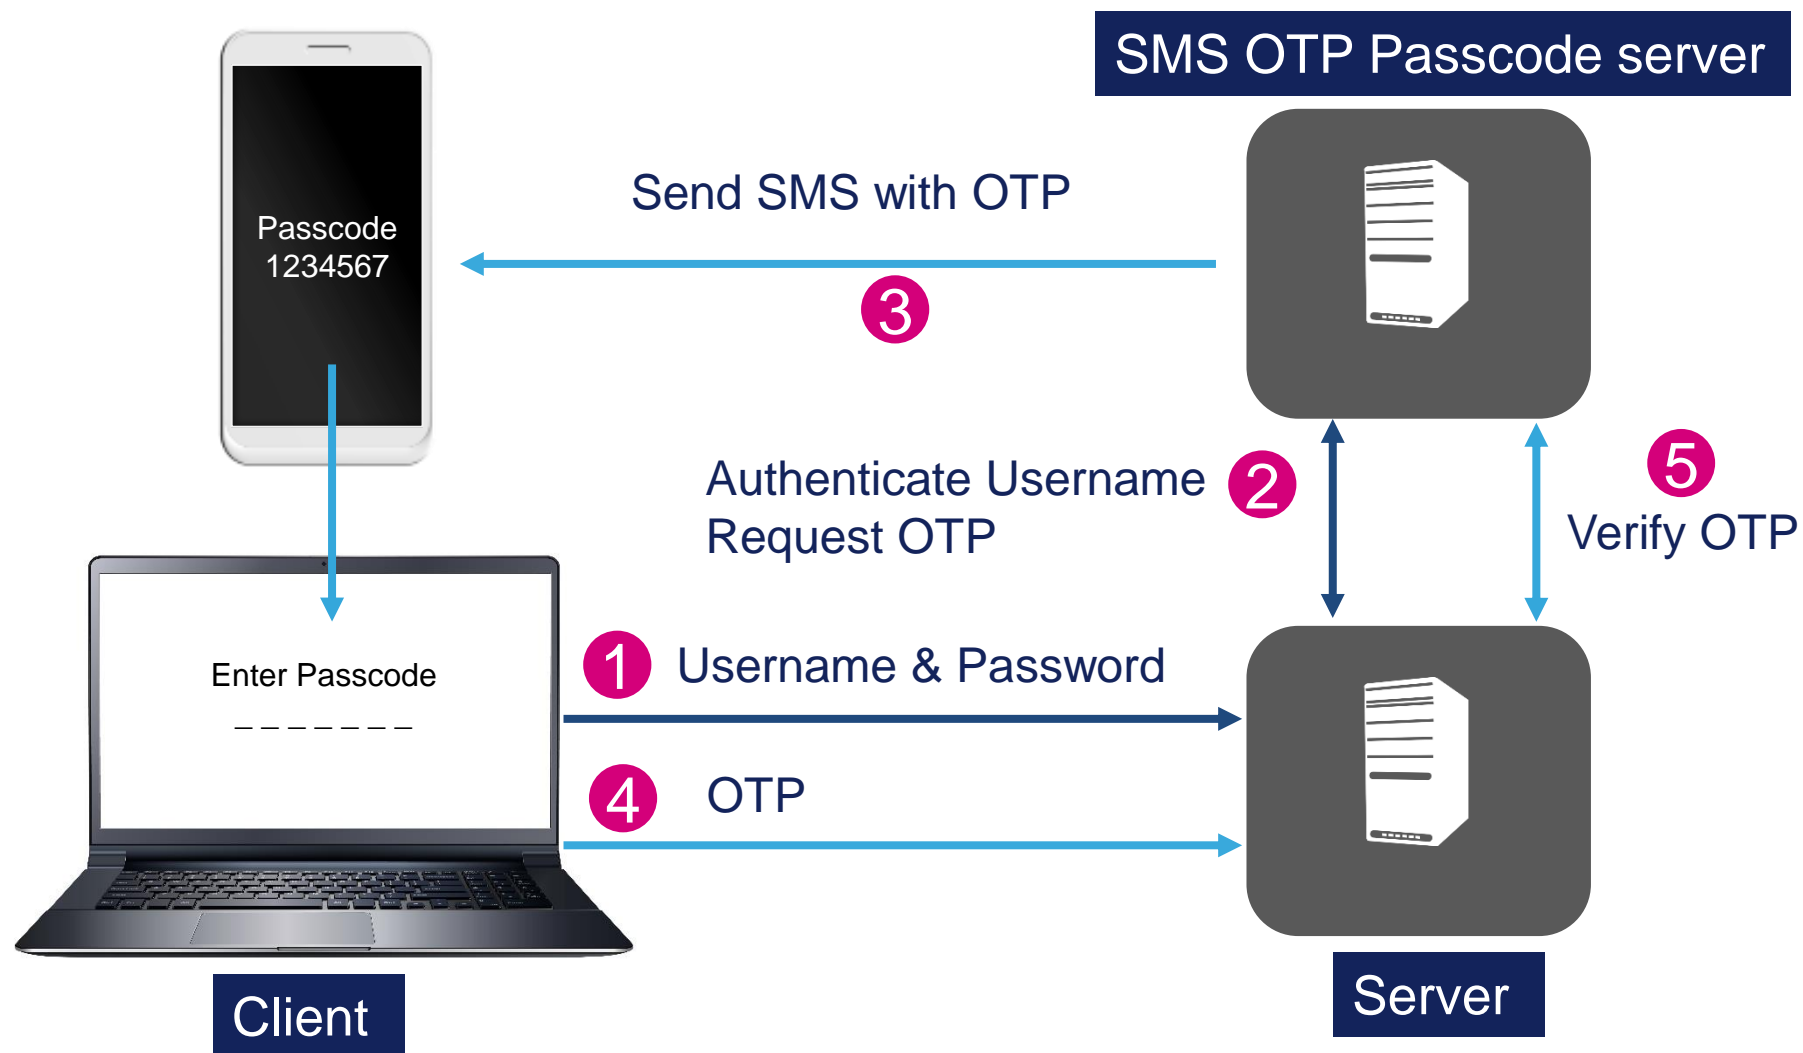

25

Data is vulnerable to attack at all points in the chain

Multichannel Authentication

26

OTP = One Time Passcode

IoT Security Challenges

27

The Future is ..

replication of the oldest computing architecture

28

The human brain has **100 billion neurons**,
1000 trillion synapses and consumes **only 20W**

It integrates sensor **processing**, data
conversion, **transmission** and **storage**,
analytics, **cognitive computing** and even
intuitive thinking!

Beyond Von Neumann Machines

29

Cognitive Systems: SyNAPSE

- “Neuron” and “synapse”-like computing model
- Systems learn through analytics / experience
- Advantages: Ultra energy-efficient, flexible, learning

Learning Pong

*Wiring diagram –
monkey brain*

‘True North’

Character ID

A Path to the Future?

30

Unprecedented scale

This second generation chip is the culmination of almost a decade of research and development, and is a huge leap forward from the initial single-core hardware prototype developed in 2011.

	2011	2014
 Programmable neurons	256	1 million
 Programmable synapses	262,144	256 million
 Neurosynaptic cores	1	4,096

1/10th of a Watt powers the neurosynaptic chip's 256 million synapses
...with the goal to simulate 1 trillion synapses using only **4 kW of energy**

Reinventing Electronics

31

- Integrating neuron based computing architectures with sensors will move more functions from the cloud to the system periphery
- Local battery operated nodes will be able to replicate a good part of the basic human activities: sense, analyze, organize data into information and decide on actions.
 - These Intelligent sensor nodes will become the core of systems
- The cloud will become the repository of the global experience where all facts will be stored, analyzed and the "learning of the species" will take place to be transferred to new generations
- It is somewhat like the difference between fast, automatic, amygdala-based responses and slower, knowledge brain-processed responses. Somewhat ...

Thank you
