• Non Evaporable Getter (NEG) is an alloy of metals (Ti-Zr-V), known for its good pumping ability

- Non Evaporable Getter (NEG) is an alloy of metals (Ti-Zr-V), known for its good pumping ability
- In the DRs, we want ultra-high vacuum, i.e. 0.1 nT

- Non Evaporable Getter (NEG) is an alloy of metals (Ti-Zr-V), known for its good pumping ability
- In the DRs, we want ultra-high vacuum, i.e. 0.1 nT
- NEG absorbs the gas molecules and helps to maintain the good vacuum

- Non Evaporable Getter (NEG) is an alloy of metals (Ti-Zr-V), known for its good pumping ability
- In the DRs, we want ultra-high vacuum, i.e. 0.1 nT
- NEG absorbs the gas molecules and helps to maintain the good vacuum
- Light sources with NEG coating: ELETTRA, SOLEIL, ESRF, MAXIV (fully coated), and foreseen for CLIC Damping Rings, the upgrade of APS, Diamond, SLS, ESRF etc

- Non Evaporable Getter (NEG) is an alloy of metals (Ti-Zr-V), known for its good pumping ability
- In the DRs, we want ultra-high vacuum, i.e. 0.1 nT
- NEG absorbs the gas molecules and helps to maintain the good vacuum
- Light sources with NEG coating: ELETTRA, SOLEIL, ESRF, MAXIV (fully coated), and foreseen for CLIC Damping Rings, the upgrade of APS, Diamond, SLS, ESRF etc
- Use of coating is suggested to mitigate some undesirable collective effects (in the electron damping ring, good vacuum will be necessary against fast beam ion instabilities) but it can contribute to the machine impedance

## Motivation for high frequency measurements

- The short rms bunch length of 1.8 mm translates into hundreds of GHz in the frequency domain
- The electromagnetic (EM) characterization of the material properties up to high frequencies is required for the impedance modeling of the DR components

## Wigglers' impedance for different coatings

Coating is transparent up to 10 GHz

## Wigglers' impedance for different coatings

Coating is transparent up to 10 GHz

## Wigglers' impedance for different coatings

- Coating is transparent up to 10 GHz
- NEG properties at high frequencies were still unexplored

Proposed method 220-330 GHz 500-750 GHz

## Proposed method

 Use of rectangular waveguides and measurement of the S<sub>21</sub> transmission coefficient

Proposed method 220-330 GHz 500-750 GHz

#### Proposed method

 S<sub>21</sub> transmission is related to the conductor loss and, therefore, is also related to the unknown material conductivity

Proposed method 220-330 GHz 500-750 GHz

#### Proposed method

 S<sub>21</sub> transmission is related to the conductor loss and, therefore, is also related to the unknown material conductivity

Proposed method 220-330 GHz 500-750 GHz

# Proposed method

 NEG coating can be applied on the inner surface of the waveguide. CERN has much expertise on the NEG coating technique

Proposed method 220-330 GHz 500-750 GHz

# Proposed method

- NEG coating can be applied on the inner surface of the waveguide. CERN has much expertise on the NEG coating technique
- The S-parameters can also be obtained numerically from 3D simulations using CST

Proposed method 220-330 GHz 500-750 GHz

### The principle of the method

 Intersecting with the measured data, the σ that matches the measured losses is extracted at a specific frequency

Proposed method 220-330 GHz 500-750 GHz

## The principle of the method

- Intersecting with the measured data, the σ that matches the measured losses is extracted at a specific frequency
- By repeating the intersection over all frequencies, the  $\sigma$  can be extracted as a function of frequency

Proposed method 220-330 GHz 500-750 GHz

#### Benchmark of the method

• Extracted conductivity for stainless steel in good agreement within 5% with the expected one

Proposed method 220-330 GHz 500-750 GHz

#### Benchmark of the method

- Extracted conductivity for stainless steel in good agreement within 5% with the expected one
- Successful benchmark for a well known material

# **NEG** coating

Coating by TE/VSC group at CERN

Proposed method 220-330 GHz 500-750 GHz

## Measurements with NEG coating

- EM interaction with NEG induces more losses
- Thick film to maximize the interaction of the field with NEG

Proposed method 220-330 GHz 500-750 GHz

## NEG effective conductivity between 10-11 GHz

• Extracted conductivity is  $(1 \pm 0.2) \times 10^6$  S/m

Proposed method 220-330 GHz 500-750 GHz

## NEG effective conductivity between 10-11 GHz

- Extracted conductivity is  $(1 \pm 0.2) \times 10^6$  S/m
- Measurements of the DC conductivity estimate values between 0.66 and 1  $\times$  10<sup>6</sup> S/m. The extracted  $\sigma$  is in good agreement with the DC value

Proposed method 220-330 GHz 500-750 GHz

#### NEG effective conductivity between 10-11 GHz

- Extracted conductivity is  $(1 \pm 0.2) \times 10^6$  S/m
- Measurements of the DC conductivity estimate values between 0.66 and 1  $\times$  10<sup>6</sup> S/m. The extracted  $\sigma$  is in good agreement with the DC value
- Frequency dependent behavior. But still too low frequencies to expect any relaxation

Proposed method 220-330 GHz 500-750 GHz

# X-ray fluorescence profile analysis

- Variation of the film thickness between 12 and 28 μm. The target value was 20 μm
- The non-uniformity was not included in CST so far

Proposed method 220-330 GHz 500-750 GHz

#### Measurements at 220-330 GHz and 500-750 GHz

- Aluminum gold-plated waveguides from Virginia Diodes Inc. (VDI)
- WR3.4: 0.864 x 0.432 mm
- WR1.5: 0.381 x 0.191 mm

Proposed method 220-330 GHz 500-750 GHz

# **NEG** coating

 Challenging coating due to the very small aperture and the rectangular shape (3 μm targeted thickness)

Proposed method 220-330 GHz 500-750 GHz

## Measurements at VDI

Full two-port S-parameter measurements were performed to measure the NEG-plated Aluminum waveguides. Each waveguide is measured in both forward and backwards orientation.

Proposed method 220-330 GHz 500-750 GHz

# $S_{21}$ measurements with NEG coating

- Measurements of DC conductivity gave values between  $0.5 \times 10^6$  S/m and  $0.7 \times 10^6$  S/m. Average value used in CST simulations
- 15% sample-to-sample variance

Proposed method 220-330 GHz 500-750 GHz

# Effective conductivity of NEG at 220-330 GHz

Frequency dependent behavior is observed

Proposed method 220-330 GHz 500-750 GHz

# Coating profile

Non-uniform coating, between 5 and 10  $\mu m$  on the bottom and 1.5 and 2  $\mu m$  on the side walls

Proposed method 220-330 GHz 500-750 GHz

## Implementation of the coating thickness in CST

1.7 um		1.7 um	
2 um		2 um	
1.5 um		1.5 um	
5 um	10 um	5 um	
1			

Proposed method 220-330 GHz 500-750 GHz

#### Effect of the non-uniform coating

- Milder dependency with frequency. Implementation of the real profile is crucial
- Extracted effective conductivity is  $(0.35 \pm 0.05) \times 10^6$  S/m, that accounts for roughness and the non-uniform film coating

220-330 GHz

#### Effect of the non-uniform coating (2)

WR-3.4

Proposed method 220-330 GHz 500-750 GHz

#### Measurements at 500-750 GHz

Proposed method 220-330 GHz 500-750 GHz

#### Implementation of a non-uniform coating in CST

Proposed method 220-330 GHz 500-750 GHz

## Effect of the non-uniform coating

WR-1.5

Extracted effective  $\sigma_{\rm NEG}$  is 0.2  $\times$  10  $^{6}$  S/m between 500 and 750 GHz

Proposed method 220-330 GHz 500-750 GHz

#### Measurements along all the frequency ranges

• Effective conductivity is a factor of 2-3 smaller than the DC

Proposed method 220-330 GHz 500-750 GHz

### Measurements along all the frequency ranges

- Effective conductivity is a factor of 2-3 smaller than the DC
- At such high frequencies, it is important to account the lower effective σ due to roughness and non-uniformity of the profile

Proposed method 220-330 GHz 500-750 GHz

# Conclusions

- The experimental method was successfully benchmarked in X-band with stainless steel waveguides
- It was applied to characterize NEG conductivity in several frequency ranges: 10-11 GHz, 220-330 GHz, 500-750 GHz
- The extracted conductivity agrees well with the DC value for 10-11 GHz
- DC conductivity measurements depend on the different cathode used in each set up
  - First setup: 0.66 and  $1 \times 10^6$  S/m
  - Second setup: 0.5 and  $0.7 \times 10^6$  S/m
- At higher frequencies, the extracted  $\sigma$  is about 20% lower from DC
- Effective conductivity at high frequencies can be significantly lower than the DC, even if relaxation effects are still not important in the frequency range

Proposed method 220-330 GHz 500-750 GHz

Thank you for your attention!

Proposed method 220-330 GHz 500-750 GHz

# Measurements with AI gold plated WR3.4 waveguide and WR1.5 waveguide

- Comparison of measured S<sub>21</sub> for a WR3.4 Al gold plated waveguide and simulated with CST Al waveguide
- Agreement within 2% for WR3.4 and around 10 15% for the WR1.5

Proposed method 220-330 GHz 500-750 GHz

# Extracted conductivity of NEG in X-band with the non-uniform profile
