## FeynCalc 9.0.0

*Monday 18 January 2016 14:25 (25 minutes)*

We present the version 9.0.0 of the Mathematica package FeynCalc, which is an open source tool for symbolic evaluation of Feynman diagrams and algebraic calculations in quantum field theory. This talk will focus on the highlights of the new version, that include improved tensor decomposition and partial fractioning routines for loop integrals. We also provide some examples for seamless interfacing of FeynCalc with other Mathematic packages for perturbative calculations using the FeynHelpers addon.
