

Charm physics at LHCb: triggering and selection

Patrick Spradlin

University of Oxford Particle Physics

Annual conference of the High Energy Particle Physics (HEPP)
group of the Institute of Physics (IOP)
Oxford, UK 06-08 April 2009

Outline

- 1 LHCb detector
 - LHC
 - LHCb
- 2 Charm physics
 - Sources of charm
- 3 The LHCb trigger
 - Trigger structure
 - Charm trigger uses
- 4 Charm selection
 - D^0 tagging
 - Creation vertex
 - Selection yields

Large Hadron Collider

LHCb detector

LHCb features

- The features that make LHCb excellent for B physics also make it a good charm physics experiment
- High event rate
- Excellent vertexing and proper time resolution: ~ 45 fs for secondary D^0
- Good tracking and momentum resolution: ~ 7 MeV D^0 mass
- Excellent K - π discrimination

Charm physics w/hadronic final states: CPV

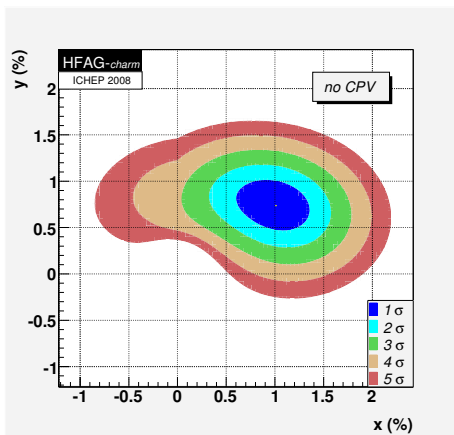

CP violation in D decays

- Currently unobserved
- SM predictions very small,
 - $\mathcal{O}(10^{-3})$ for singly Cabibbo suppressed (SCS) (e.g. $D^0 \rightarrow K^- K^+$),
 - Negligibly small for Cabibbo favored (CF) and doubly suppressed (DCS).
- Measurements in many decay modes,
 - Relative decay rates,
 - Final state distributions (e.g. Dalitz space) in multibody decays,
 - CP violation in mixing.
- Individual experimental upper limits $\sim 0.5\%$.

$D^0 \rightarrow K^- K^+$ measurements (1σ)

Charm physics w/hadronic final states: mixing

$D^0-\bar{D}^0$ mixing

- Recent strong evidence of mixing,
 - Three independent 3σ measurements.
- Observed level consistent with standard model,
 - SM mixing very small: $\mathcal{O}(10^{-3})$,
 - Useful constraints on new physics models.
- CP violation in mixing.

Two sources of charm

Prompt production

- + Prolific production
- + Strong potential on early data
- 0 Less efficient in trigger
- Potentially larger backgrounds
- Unavoidable significant proper time acceptance effects
- + CDF proved that measurements are possible in hadronic environment

B decays ($B \rightarrow D^{(*)} X$)

- + Strongly favored by LHCb triggers
- + Potentially less background
- New techniques need to be developed—no published measurements

LHCb trigger

Two stage trigger:

- **40 MHz** crossing rate at nominal design luminosity.
- L0 hardware trigger — high p_t particles,
 - Subset of detector information,
 - Fast decision,
 - **1 MHz** output rate.
- High Level Trigger (HLT) in software — physics signatures
 - Software trigger running in event farm,
 - All detector information available,
 - Multiple layers with increasing levels of decision complexity.
- \sim **2 kHz** output rate.

L0 trigger

- Identify single particle b -hadron decay products,
 - Final state particles (π , K , e , γ , μ) with significant p_t ,
 - Threshold p_t values of a few GeV,
 - Sets of thresholds optimized for physics goals.
- **40 MHz** input \rightarrow **1 MHz** output

High Level Trigger stage 1 (HLT1)

- First stage of software trigger,
- Identify 1 and 2 final state particle signatures,
- Parallel trigger paths for various final state particles,
- Fast identification of simple B event features,
 - High p_t particles (hadrons, muons, electrons, and photons),
 - Charged tracks with sizable impact parameter with respect to primary interaction vertex (PV),
- Products of prompt D have smaller mean p_t than those of secondary D .

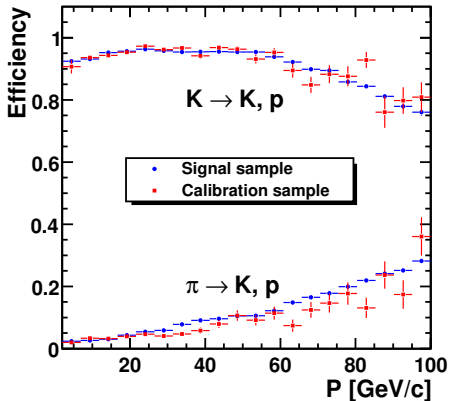

High Level Trigger stage 2 (HLT2)

- Require events pass HLT1,
- Reduced input rate allows compute-intensive reconstruction,
- Complete final state reconstruction,
- Channels for specific topologies,
 - Inclusive selections of related groups of decays,
 - Exclusive decay chain, e.g., $D^{*+} \rightarrow \pi_s^+ D^0 (h^- h^+)$
- Channels can also be layered with increasing precision of parameter estimates.
- **2 kHz** total output rate

Uses of LHCb D^{*+} trigger

Charm physics

RICH calibration

D^{*+} tagging

- CP violation and mixing studies with D^0 requires 'tagging' as D^0 or $\overline{D^0}$,
- Same-side tag for D^0 flavor,
- Reconstruct $D^{*+}(2010) \rightarrow D^0 \pi_s^+ + \text{c.c.}$,
 - Strong decay, instantaneous,
 - 'Slow' pion, π_s^\pm , charge identifies D^0 or $\overline{D^0}$.
- Tightly constrained phase space,
 - $m_{D^{*+}} - m_{D^0} \equiv \Delta m = 145.421 \pm 0.010 \text{ MeV}$,
- Very narrow peak in Δm ,
 - Clear signal/background discriminant.

Vertex resolution for mixing

Decay vertex resolutions

	D^0	D^{*+}
x	$21.6 \mu\text{m}$	$187. \mu\text{m}$
y	$16.9 \mu\text{m}$	$144. \mu\text{m}$
z	$257. \mu\text{m}$	$4232. \mu\text{m}$
τ	0.465 ps	

- D^{*+} vertex poorly estimated,
- D^0 and π_S^+ almost collinear,
- Add tracks at birth vertex.

Signal MC lab frame angles

D^0 flight distance at 60 GeV:

$$\beta\gamma c\tau \approx 4 \text{ mm}$$

Birth vertex improvement for secondary charm

Decay vertex resolutions

	D^0	D^{*+}	B_{part}
x	$21.6 \mu\text{m}$	$187. \mu\text{m}$	$18.1 \mu\text{m}$
y	$16.9 \mu\text{m}$	$144. \mu\text{m}$	$18.4 \mu\text{m}$
z	$257. \mu\text{m}$	$4232. \mu\text{m}$	$237. \mu\text{m}$

Improved proper time resolution = 0.045 ps

- Use additional tracks at production vertex,
- For prompt charm: use PV,
- For D^0 from B : use 1 additional track from parent B .

Selection yields

Estimated selection yields for two body hadronic channels

- $D^{*+} \rightarrow \pi_s D^0, D^0 \rightarrow hh'$
 - $h, h' \in \{K^\pm, \pi^\pm\}$
- Tagged selections,
 - CP violation measurements,
 - Time-dependent mixing measurements.
- Yield estimates include trigger.

Estimated selection yields in 2 fb^{-1}

	$D^0 \rightarrow K^- \pi^+$	$\rightarrow K^- K^+$	$\rightarrow \pi^- \pi^+$
Prompt signal yield ($\times 10^6$)	109 ± 12	10 ± 3	2 ± 1
S/B	8	6	> 2
Secondary signal yield ($\times 10^6$) [†]	12.38 ± 0.59	1.32 ± 0.19	0.50 ± 0.12
S/B	5	5	3

See Philip Xing's talk for physics estimates with this selections

Summary

- First collisions at LHC are imminent,
- LHCb will record unprecedented numbers of charm events,
- Efforts are underway to exploit both prompt and secondary sources for charm physics analyses,
- **See talk by Philip Xing in this session for estimates of physics performance.**
