# The Nobel Prize in Physics 2008

and the B FACTORIES **SLAC**  
NATIONAL ACCELERATOR LABORATORY

## The Nobel Prize in Physics 2008 was awarded to

Makoto Kobayashi  
High Energy Accelerator Research Organization (KEK),  
Tsukuba, Japan

Toshihide Maskawa  
Kyoto Sangyo University, Yukawa Institute for Theoretical Physics (YITP)  
Kyoto University, Kyoto, Japan

and to Yoichiro Nambu, Enrico Fermi Institute, University of Chicago, IL, USA  
"for the discovery of the mechanism of spontaneous broken symmetry in subatomic physics."

"for the discovery of the origin of the broken symmetry which predicts the existence of at least three families of quarks in nature"

BaBar

PEP-II

Belle

KEK-B

"for the discovery of the origin of the broken symmetry which predicts the existence of at least three families of quarks in nature"

## Broken Symmetries Predicted Extra Quarks

Matter and antimatter are nearly exact opposites of each other. But this near-perfect symmetry is broken in nature as we observe it. In 1972, Kobayashi and Maskawa discovered that the root of the mystery could be explained by the properties of quarks, the fundamental constituents of protons and neutrons, but only if there were three more types of quarks than had previously been observed. At that time, experimenters had seen the up, down, and strange quarks, but the charm, bottom, and top would not be discovered until later.

## B Factory Experiments Confirmed the Predictions

Experiments at the B factories in the United States and Japan in the early 2000s made detailed investigations of billions of high-energy particles containing bottom quarks. International Collaborations at the B factories made numerous measurements of the parameters of the Cabibbo, Kobayashi, and Maskawa (CKM) mixing matrix and confirmed the precise links of these with the observed differences between matter and anti-matter. The B factories each consist of an accelerator and a particle detector. At the SLAC National Accelerator Laboratory in California, USA, the PEP-II accelerator provides the collisions observed by the BaBar detector. At KEK in Tsukuba, Japan, the KEK-B accelerator supplies the Belle detector with the particles needed for these studies.

"Please accept our deepest respect and gratitude for the B factory achievements. In particular, the high-precision measurement of CP violation and the determination of the mixing parameters are great accomplishments, without which we would not have been able to earn the Prize."

小林 錦 (Makoto Kobayashi)  
益川 敏英 (Toshihide Maskawa)

"Please accept our deepest respect and gratitude for the B factory achievements. In particular, the high-precision measurement of CP violation and the determination of the mixing parameters are great accomplishments, without which we would not have been able to earn the Prize."

# Disclaimer

- Flavor physics is a rich and vibrant field
  - O(100) abstracts at ICHEP08.
- This talk: CKM matrix
  - Magnitude, angles and phase of the matrix.
  - Will focus on the newest results, and summaries.
  - Charm physics and hadron spectroscopy not included.
  - My apologies if I omit your favorite paper !
- Talks in parallel sessions at this conference:
  - 1B
  - 2B

# Outline

- The theoretical and experimental environment.
- The angles of the Unitarity Triangle.
- The magnitude of the elements of the CKM matrix.
- Perspectives and Conclusions.

# Outline

# CKM Matrix

$$\begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{td} \end{pmatrix}$$

Measure magnitudes from rates:

A Feynman diagram showing a quark  $q_i$  decaying into a quark  $q_j$  and a  $W$  boson, with the vertex labeled  $gV_{ij}$ . The diagram is enclosed in large vertical bars, and the expression is followed by a superscript 2 and an approximation symbol  $\sim |V_{ij}|^2$ .

Measure phases through interference: CP violation. Need at least two amplitudes, e.g. 2 decay amplitudes (“direct CPV”), or decay and mixing

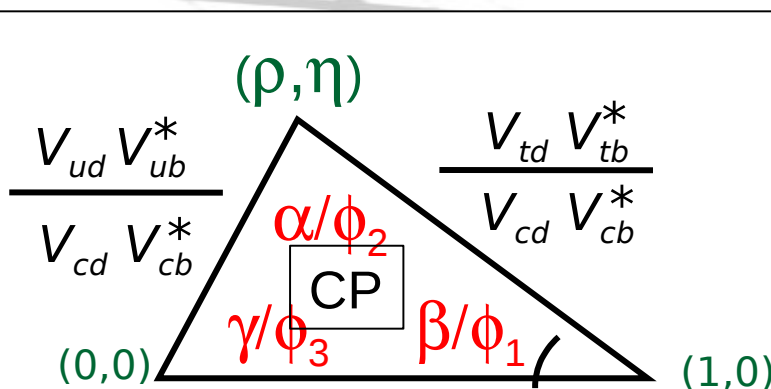

# Unitarity Triangle

Unitary mixing matrix: 4 parameters (*c.f.* MNSP matrix in neutrinos)  
 For quarks, conventional Wolfenstein parameterization:

$$A, \rho, \eta \sim \mathcal{O}(1), \lambda \equiv \sin \theta_c \approx 0.22$$

$$V = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} \approx \begin{pmatrix} 1 - \lambda^2/2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \lambda^2/2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix} + \mathcal{O}(\lambda^4)$$

$$V_{ud}V_{ub}^* + V_{cd}V_{cb}^* + V_{td}V_{tb}^* = 0 \quad : \text{unitarity relation for } B_d \text{ decays}$$

$\alpha, \beta, \gamma$  BaBar

$\phi_1, \phi_2, \phi_3$  Belle

$$\alpha \equiv \arg \left[ -\frac{V_{td}V_{tb}^*}{V_{ud}V_{ub}^*} \right] \quad : \text{interfere } b \rightarrow u \text{ \& mixing}$$

$$\beta \equiv \arg \left[ -\frac{V_{cd}V_{cb}^*}{V_{td}V_{tb}^*} \right] \quad : \text{interfere } b \rightarrow c \text{ \& mixing}$$

$$\gamma \equiv \arg \left[ -\frac{V_{ud}V_{ub}^*}{V_{cd}V_{cb}^*} \right] \quad : \text{interfere } b \rightarrow u \text{ \& } b \rightarrow c$$

# Common Definitions

*CP* violation in interference between decays with and without mixing:

$$\lambda_{f_{CP}} = \eta_{CP} \frac{q}{p} \cdot \frac{\bar{\mathcal{A}}_{\bar{f}_{CP}}}{\mathcal{A}_{f_{CP}}} \leftarrow \text{amplitude ratio}$$

*CP* eigenvalue  $\rightarrow \eta_{CP} = \pm 1$ ;  $\phi_{CP} = \alpha, \beta, \gamma$

$$\approx e^{-2i\phi_{CP}} \leftarrow \text{CP phase}$$

Time-dependent *CP* Observable:

$$A_{f_{CP}}(t) = \frac{\Gamma(\bar{B}_{phys}^0(t) \rightarrow f_{CP}) - \Gamma(B_{phys}^0(t) \rightarrow f_{CP})}{\Gamma(\bar{B}_{phys}^0(t) \rightarrow f_{CP}) + \Gamma(B_{phys}^0(t) \rightarrow f_{CP})}$$

$$= C_{f_{CP}} \cdot \cos(\Delta m_{B_d} t) + S_{f_{CP}} \sin(\Delta m_{B_d} t)$$

$$C_{f_{CP}} = \frac{1 - |\lambda_{f_{CP}}|^2}{1 + |\lambda_{f_{CP}}|^2}$$

$$S_{f_{CP}} = \frac{-2 \text{Im} \lambda_{f_{CP}}}{1 + |\lambda_{f_{CP}}|^2}$$

$$C_{f_{CP}} = 0 \quad S_{f_{CP}} = \sin 2\beta \text{ for } J/\psi K_s$$

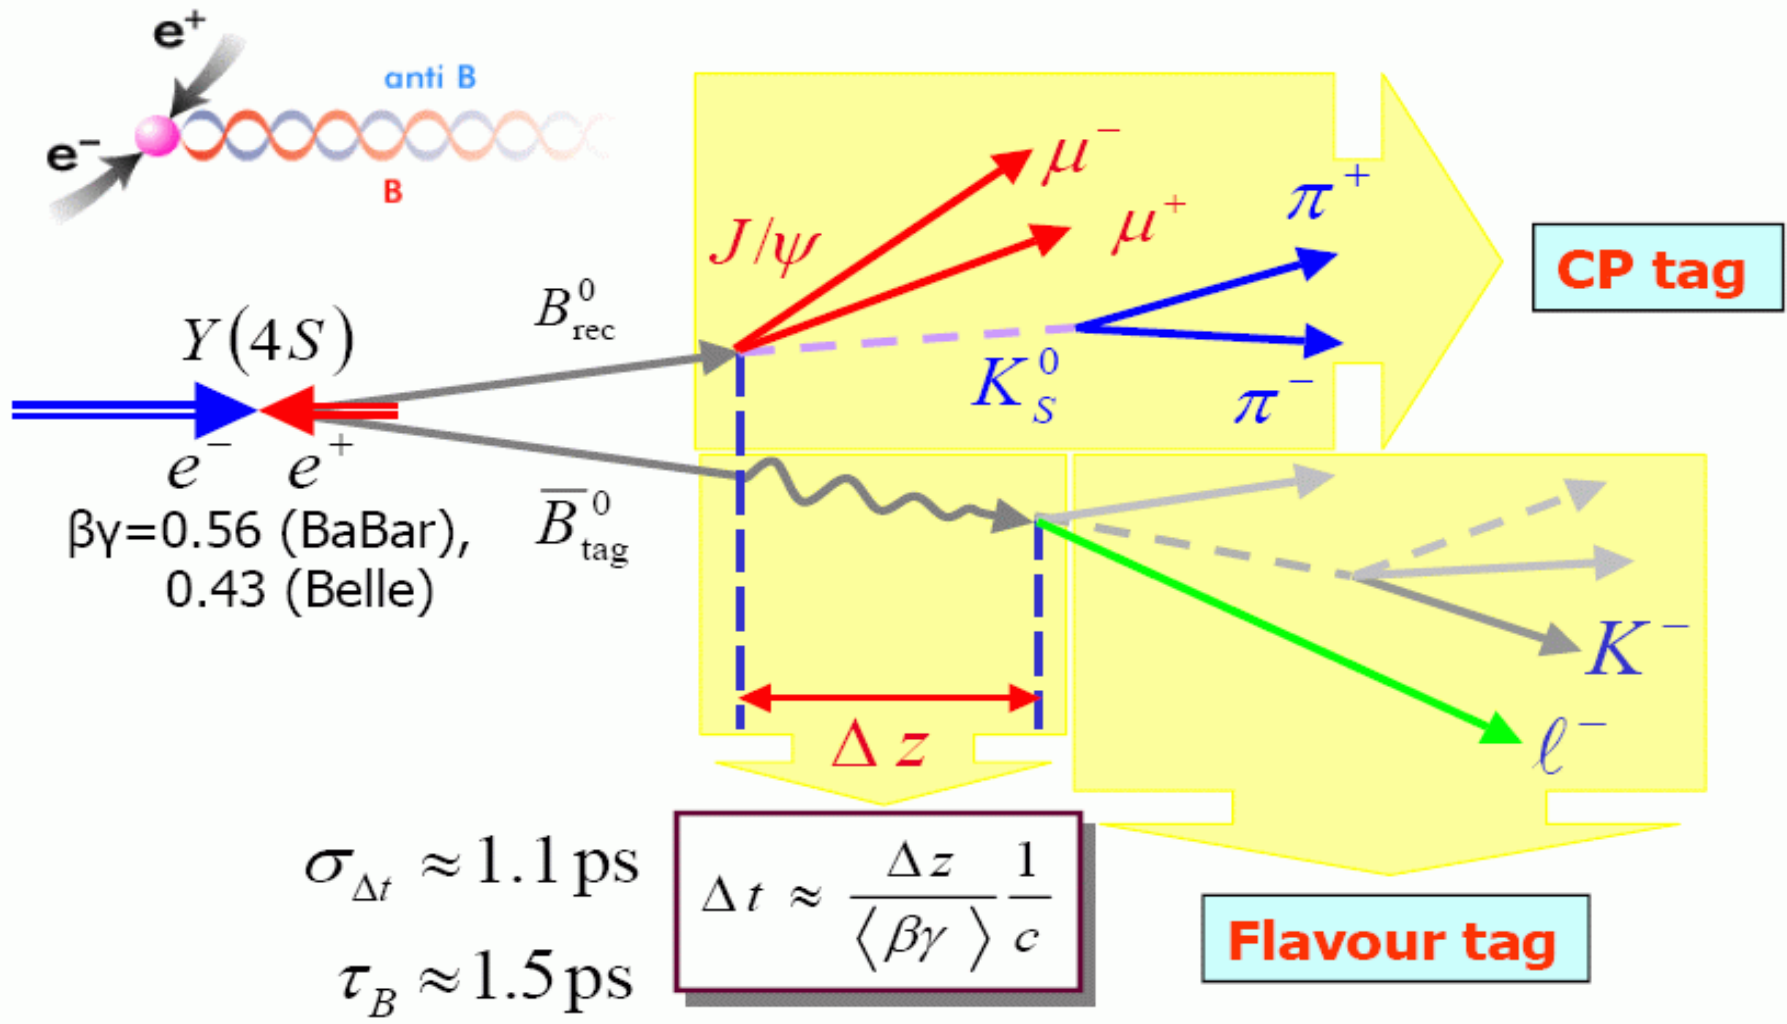

$$C_{f_{CP}} = 0 \quad S_{f_{CP}} = \sin 2\alpha \text{ for } \pi^+ \pi^-$$

(if tree only)

# Measuring the CP parameters

$e^+e^-$  colliders @  $Y(4S)$  resonance  
 ....but also run @  $Y(2S)$ ,  $Y(3S)$  and  $Y(5S)$ !

$e^+e^- \rightarrow$  hadrons cross section vs. energy (CLEO)

$e^+e^- \rightarrow Y(4S) \rightarrow B\bar{B}$  (~1nb)  
 $e^+e^- \rightarrow q\bar{q}$ : main background (~3nb)  
 B-Factory also a charm and tau factory

# Outline

- The theoretical and experimental environment.
- **The angles of the Unitarity Triangle.**
- The magnitude of the elements of the CKM matrix.
- Perspectives and Conclusions.

# Angle $\beta$ : “Golden” Channel $b \rightarrow c\bar{c}s$

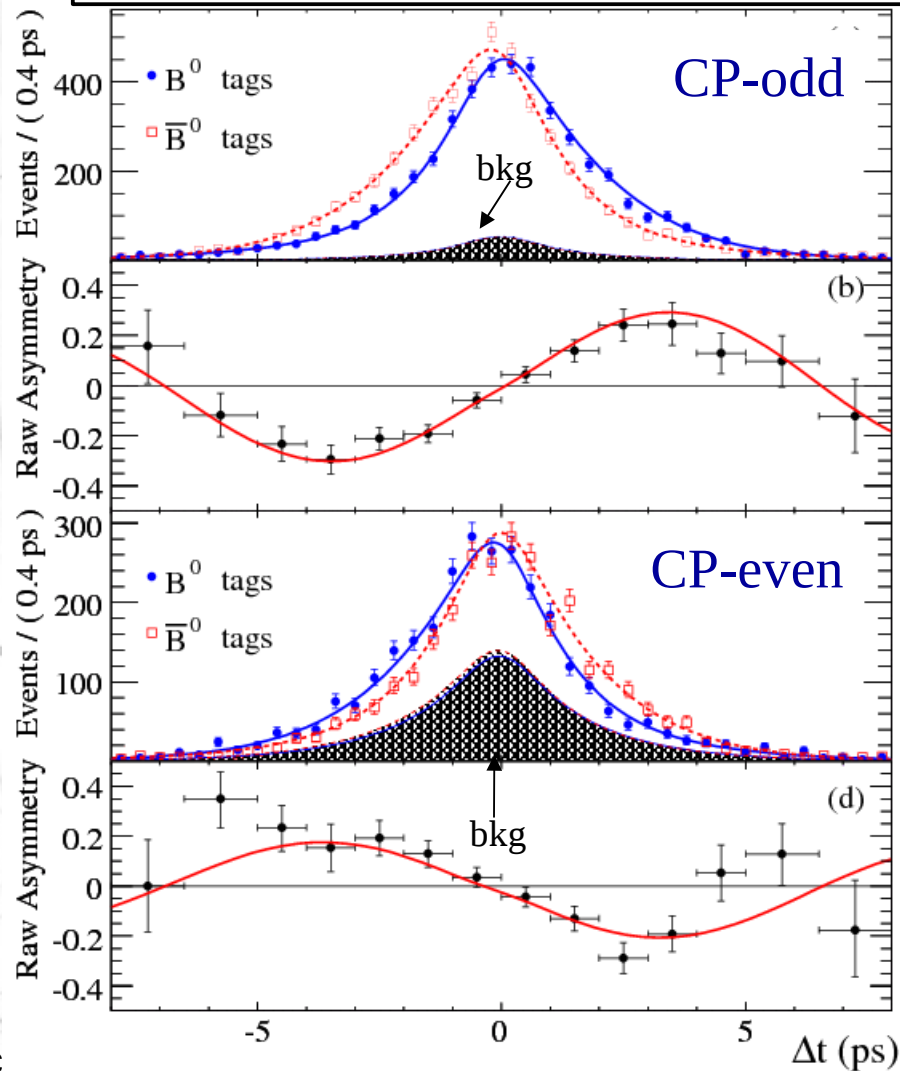

$$S = \sin 2\beta$$

$$C = 0$$

Belle: PRL98, 031802 (2007)

arXiv0902.1708 [hep-ex] submitted to PRD

# Angle $\beta$ : “Golden” Channel $b \rightarrow c\bar{c}s$

$$\sin(2\beta) \equiv \sin(2\phi_1)$$

**HFAG**  
ICHEP 2008  
PRELIMINARY

- Most precise measurements of CPV in B decays to date.
- BaBar results for the final dataset.
- Still statistically-limited measurements.
- Theoretical uncertainty for  $\sin 2\beta$  from charmonium modes below 0.01:

further improvements from LHCb and Super B factories.

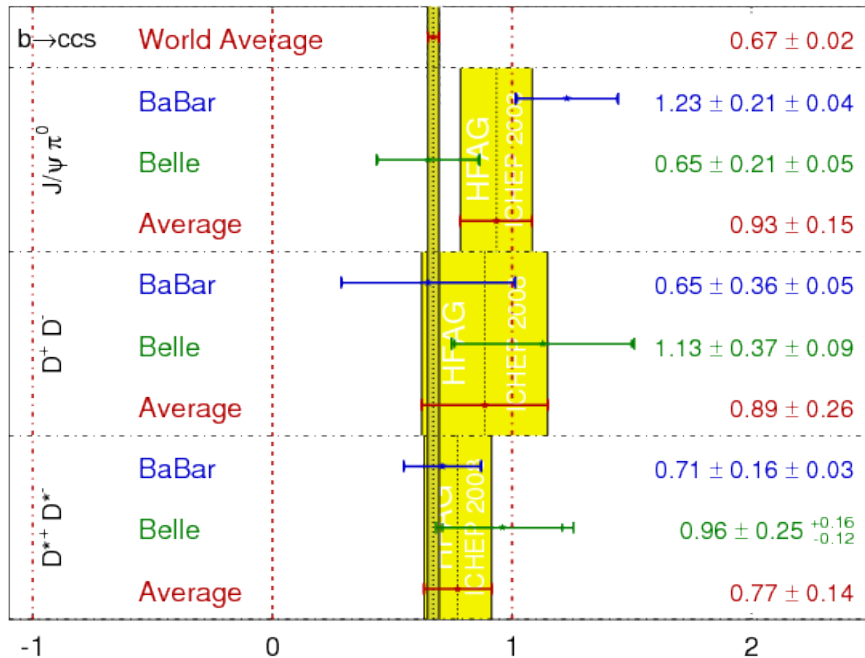

# More on Angle $\beta$ : $b \rightarrow c\bar{c}d$

Tree amplitudes Cabibbo-suppressed: potential sensitivity to penguin (loop) effects

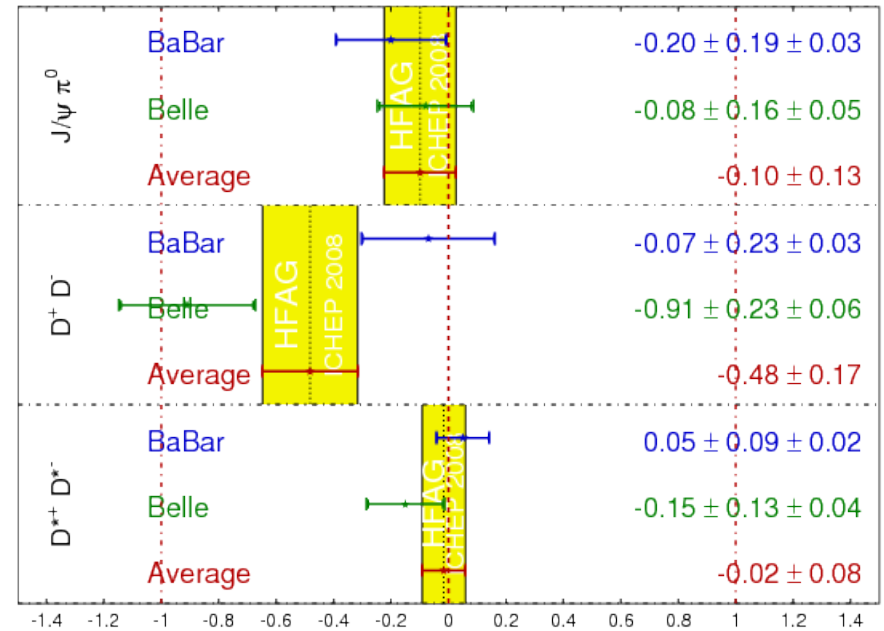

$$\sin(2\beta^{\text{eff}}) \equiv \sin(2\phi_1^{\text{eff}})$$

**HFAG**  
ICHEP 2008  
PRELIMINARY

$$C_f = -A_f$$

**HFAG**  
ICHEP 2008  
PRELIMINARY

CP violation clearly established.  
Good agreement with golden modes.

More info needed for C in  $D^+ D^-$  modes.

# More on Angle $\beta$ : $b \rightarrow q\bar{q}s$ (penguin)

Penguin only or penguin dominated modes.

some of recent QCDF estimates

$$\sin 2\beta_{\text{eff}}^f - \sin 2\beta$$

$$\sin(2\beta^{\text{eff}}) \equiv \sin(2\phi_1^{\text{eff}})$$

**HFAG**  
CKM2008  
PRELIMINARY

More statistics crucial for mode-by-mode studies and comparison with theory.

# Angle $\alpha$

- Time-dependent CPV in  $b \rightarrow u$  transitions.
- Problem: 2-3 amplitudes, additional interference.
  - “Penguin” pollution:  $S_{\text{eff}} = \sqrt{1 - C^2} \times \sin(2\alpha - 2\Delta\alpha)$
- Isospin analysis to measure  $\Delta\alpha$ .
  - 4-fold ambiguity in  $\Delta\alpha$ .
  - Small branching fractions.
- Most useful modes:
  - $B \rightarrow \rho\rho, \pi\pi, \rho\pi$

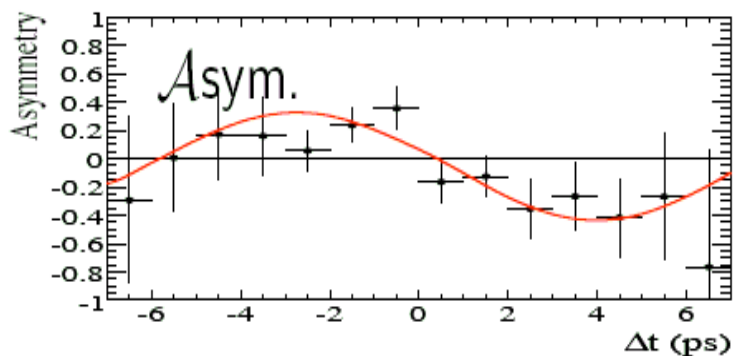

Gronau, London, PRL65, 3381 (1990)

# $\alpha$ from $B \rightarrow \pi\pi$

From BaBar:

$B^0 \rightarrow \pi^+\pi^-, \pi^0\pi^0$  (arXiv:0807:4226)

$\pi^+ \pi^- S_{CP}$  vs  $C_{CP}$

**HFAG**  
ICHEP 2008  
PRELIMINARY

CP violation clearly established.  
Difference BaBar-Belle  $1.9\sigma$

Contours give  $-2\Delta(\ln L) = \Delta\chi^2 = 1$ , corresponding to 60.7% CL for 2 dof

# Interpretation

BABAR  
arXiv:0807:4226

	$\mathcal{B}(10^{-6})$	$C$
$\pi^+\pi^-$	$5.5 \pm 0.4 \pm 0.3$	$-0.25 \pm 0.08 \pm 0.02$
$\pi^+\pi^0$	$5.02 \pm 0.46 \pm 0.29$	—
$\pi^0\pi^0$	$1.83 \pm 0.21 \pm 0.13$	$-0.43 \pm 0.26 \pm 0.05$

$\mathcal{B}(\pi^0\pi^0) \sim \mathcal{B}(\pi^+\pi^-)$ :  $\Delta\alpha$  could be large

$\pi^+\pi^- S_{CP}$

**HFAG**  
ICHEP 2008  
PRELIMINARY

# $\alpha$ from $B \rightarrow \rho\rho$

BaBar (PRD78,071104) :  $B^0 \rightarrow \rho^0 \rho^0$

$$\mathcal{B} = (0.92 \pm 0.32 \pm 0.14) \times 10^{-6}$$

$$f_L = 0.75_{-0.14}^{+0.11} \pm 0.04$$

$$S^{00} = +0.3 \pm 0.7 \pm 0.2$$

$$C^{00} = +0.2 \pm 0.8 \pm 0.3$$

3.1 $\sigma$  evidence for  $\rho^0 \rho^0$

Belle (PRD78,111102) :  $B^0 \rightarrow \rho^0 \rho^0$

$$\mathcal{B} = (0.4 \pm 0.4 \pm 0.2) \times 10^{-6}$$

World averages:

$$\mathcal{B}_{\rho^0 \rho^0} = (0.72 \pm 0.28) \times 10^{-6}$$

$$\mathcal{B}_{\rho^+ \rho^-} = (24.2 \pm 3.2) \times 10^{-6}$$

$$\mathcal{B}(\rho^0 \rho^0) \ll \mathcal{B}(\rho^+ \rho^-)$$

# Interpretation

$$\sigma(\alpha_{\text{eff}}) \sim 6^\circ, \Delta\alpha < 14.16^\circ$$

# Summary of $\alpha$

$\alpha \in [83.5 ; 94.0]^\circ @ 68\% \text{ CL}$

# Angle $\gamma$

- Hardest angle of all to tackle
  - $\gamma = -\arg(V_{ub})$ , and  $V_{ub}$  is small
- Direct CPV in  $B \rightarrow D^{(*)0} K^{(*)}$  decays
  - 3-body Dalitz Decays (Giri, Grossman, Soffer, Zupan)  
 $D^0 \rightarrow K_s \pi^+ \pi^-$
  - CP eigenstates (Gronau, London, Wyler)  
 $D^0 \rightarrow \pi\pi, KK, \dots$
  - Doubly Cabibbo-suppressed (Atwood, Dunietz, Soni)  
 $D^0 \rightarrow K^+ \pi^-$  vs  $D^0 \rightarrow K^- \pi^+$
- Several complementary techniques
  - Time-dependent CPV in  $B^0 \rightarrow D^{(*)} \pi, D^{(*)} \rho$   
Measures  $\sin(2\beta + \gamma)$
- Key parameter:  $r_B$ , ratio of  $|A(b \rightarrow u)/A(b \rightarrow c)|$

CLEO-c

Difficult, statistics-limited measurements! Combination of constraints:

$\gamma = (70 \pm 28)^\circ$ , uncertainty of  $\sim 28^\circ$ . Larger statistics needed (LHCb, SuperB)

- But  $|V_{us}|$  can be extracted from  $\tau$  decays in final states with kaons.
- However,  $|V_{us}| \sim 3\sigma$  below  $|V_{us}|$  from  $K_{\ell 3}, K_{\ell 2}$
- Possibly due to convergence of the OPE series (arXiv:0807.3195 [hep-ph])

BaBar measurement:

$$\frac{\mathcal{B}(\tau^- \rightarrow K^- \nu_\tau)}{\mathcal{B}(\tau^- \rightarrow \pi^- \nu_\tau)} = \frac{f_K^2 |V_{us}|^2 \left(1 - \frac{m_K^2}{m_\tau^2}\right)^2}{f_\pi^2 |V_{ud}|^2 \left(1 - \frac{m_\pi^2}{m_\tau^2}\right)^2} = 0.06531 \pm 0.00056 \pm 0.00093$$

Using  $f_K/f_\pi = 1.189 \pm 0.007$  from  
E.Follana *et al.* Phys. Rev. Lett. 100, 062002 (2007)

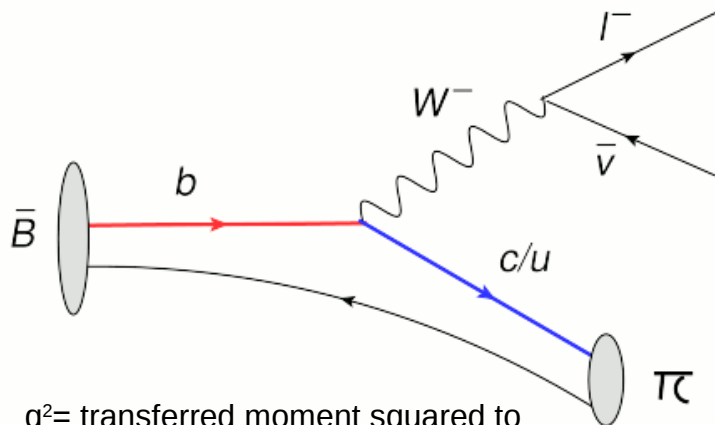

$$|V_{us}| = 0.2255 \pm 0.0023$$

Consistent with  $|V_{us}|$  from  $K_{\ell 3}, K_{\ell 2}$

# Semileptonic B decays

Exclusive final state

$q^2 =$  transferred moment squared to the  $l\nu$

Inclusive final state

$$\frac{\Gamma(b \rightarrow ul^{-}\bar{\nu})}{\Gamma(b \rightarrow cl^{-}\bar{\nu})} = \frac{|V_{ub}|^2}{|V_{cb}|^2} \simeq \frac{1}{50}$$

$$d\Gamma/dq^2 = \frac{G_F^2 |V_{qb}|^2}{192\pi^3} |f_+(q^2)|^2$$

Experimentally:  
good signal/background but  
proportional to form factor. Need  
Lattice QCD.

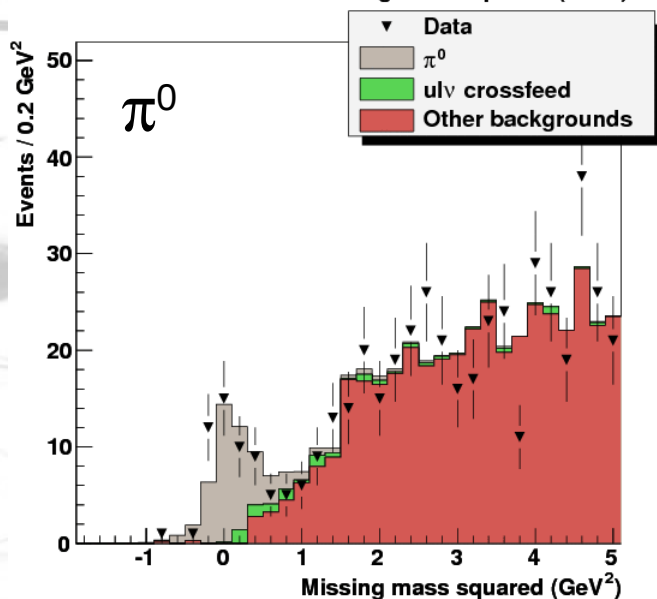

$$\Gamma = \frac{G_F^2 |V_{qb}|^2}{192\pi^3} m_b^5 (1 + \dots)$$

Total width easy to compute but,  
in  $b \rightarrow u$ , kinematic cuts  
are essential to reduce  $b \rightarrow c$   
background.

**Exclusive and inclusive decays have different strength, complementary!**

known  $\theta_{13}$ : a turning point to the era of precision measurements

# SuperB (In a Nutshell)

## Site: Tor Vergata Campus (Rome II)

- Asymmetric energy  $e^+e^-$  collider
- Low emittance operation (like LC)
- Polarised beams
- Luminosity  $10^{36} \text{ cm}^{-2}\text{s}^{-1}$ 
  - $75\text{ab}^{-1}$  data at the  $\Upsilon(4S)$
  - Collect data at other  $\sqrt{s}$
  - Start data taking as early as 2015

- Crab Waist technique developed to achieve these goals

## International Community

Geographical distribution of CDR signatories.

## Precision B, D and $\tau$ decay studies and spectroscopy

- New Physics in loops
  - 10 TeV reach at  $75\text{ab}^{-1}$
  - Rare decays
  - $\Delta S$  CP violation measurements
- Lepton Flavour & CP Violation in  $\tau$  decay
- Light Higgs searches
- Dark Matter searches

# Conclusions

- High-precision measurements from the B-factories (**final dataset from BaBar ~500M B**). Belle continues operations to O(1000M decays)
  - Overall, excellent agreement between sides and angles of the Unitarity Triangle.  
But a few tantalizing hints.
  - Nontrivial constraints on the flavor of new physics.
- Still statistics limited.
  - $\sigma(\beta) \sim 2^\circ$ ; theory errors below  $1^\circ$ .
  - $\sigma(\alpha) \sim 10^\circ$ ; limited by measurements of penguin pollution.
  - $\sigma(\gamma) \sim 15^\circ$ ; limited by statistics and theory.
  - $\sigma(|V_{ub}|) \sim 7^\circ$ ; the real limitation is from theory errors.
- **CPV measurements** in the B system will continue to provide important insights and constraints on the **flavor structure** of physics within and **beyond the Standard Model**.
