

LHCb's potential in D0 mixing and CP violation

Monday 6 April 2009 17:15 (15 minutes)

LHCb has great potential for making important measurements in the charm sector. The core of this programme includes the precise measurements of the mixing parameters in D^0 - D^0 bar oscillations and the search for CP-violation in D-decays. The talk will present the results of MC studies which quantify LHCb's potential sensitivity in this area. Discussion will also be given to the RICH system, whose K-Pi discrimination power is critical in the charm analysis.
