

### Introduction to HDFS

**Prasanth Kothuri**, CERN

#### What's HDFS

- HDFS is a distributed file system that is fault tolerant, scalable and extremely easy to expand.
- HDFS is the primary distributed storage for Hadoop applications.
- HDFS provides interfaces for applications to move themselves closer to data.
- HDFS is designed to 'just work', however a working knowledge helps in diagnostics and improvements.

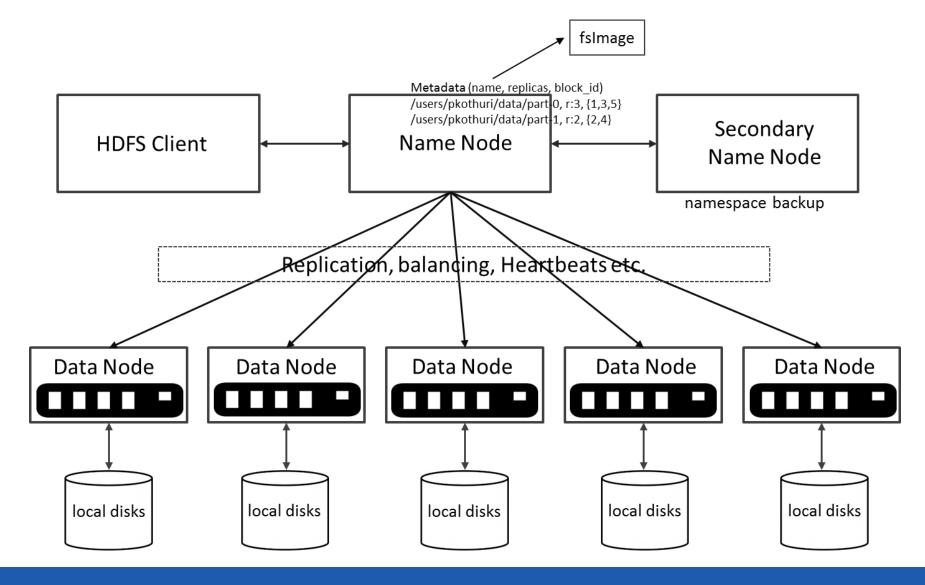

# Components of HDFS

There are two (and a half) types of machines in a HDFS cluster

- NameNode :- is the heart of an HDFS filesystem, it maintains and manages the file system metadata. E.g; what blocks make up a file, and on which datanodes those blocks are stored.
- <u>DataNode</u>: where HDFS stores the actual data, there are usually quite a few of these.

#### **HDFS** Architecture

### Unique features of HDFS

HDFS also has a bunch of unique features that make it ideal for distributed systems:

- <u>Failure tolerant</u> data is duplicated across multiple DataNodes to protect against machine failures. The default is a replication factor of 3 (every block is stored on three machines).
- Scalability data transfers happen directly with the DataNodes so your read/write capacity scales fairly well with the number of DataNodes
- Space need more disk space? Just add more DataNodes and rebalance
- Industry standard Other distributed applications are built on top of HDFS (HBase, Map-Reduce)

HDFS is designed to process large data sets with write-once-read-many semantics, it is not for low latency access

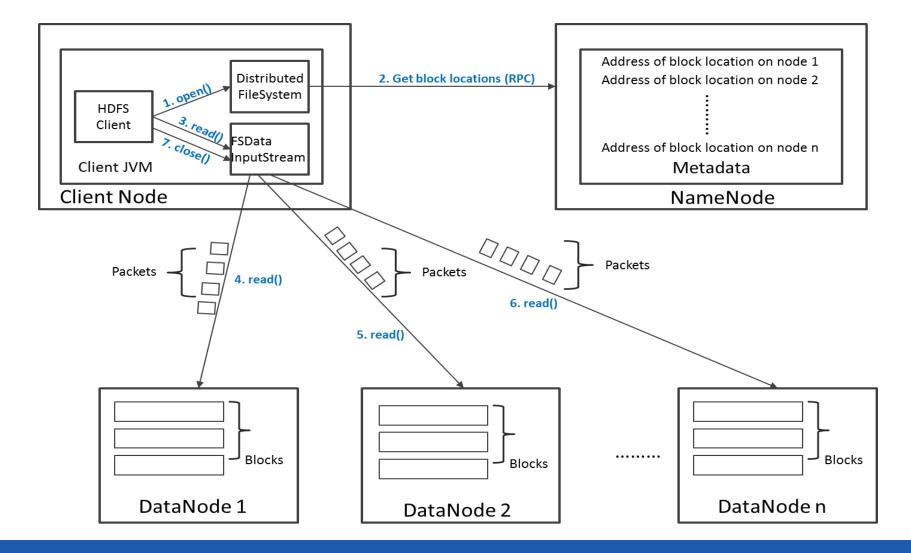

# HDFS – Data Organization

- Each file written into HDFS is split into data blocks
- Each block is stored on one or more nodes
- Each copy of the block is called replica
- Block placement policy
  - First replica is placed on the local node
  - Second replica is placed in a different rack
  - Third replica is placed in the same rack as the second replica

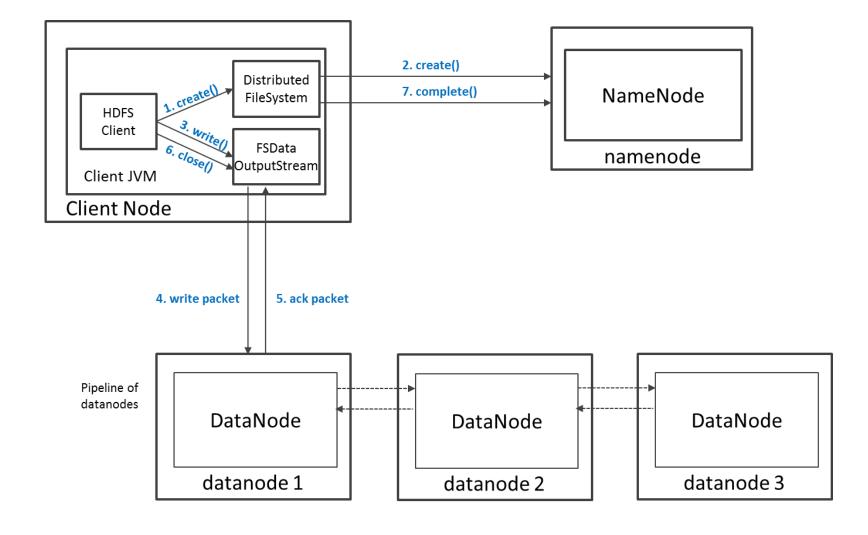

# Read Operation in HDFS

# Write Operation in HDFS

# **HDFS Security**

- Authentication to Hadoop
  - Simple insecure way of using OS username to determine hadoop identity
  - Kerberos authentication using kerberos ticket
  - Set by hadoop.security.authentication=simple|kerberos
- File and Directory permissions are same like in POSIX
  - read (r), write (w), and execute (x) permissions
  - also has an owner, group and mode
  - enabled by default (dfs.permissions.enabled=true)
- ACLs are used for implemention permissions that differ from natural hierarchy of users and groups
  - enabled by dfs.namenode.acls.enabled=true

# **HDFS Configuration**

#### **HDFS** Defaults

- Block Size 64 MB
- Replication Factor 3
- Web UI Port 50070

```
HDFS conf file - /etc/hadoop/conf/hdfs-site.xml
```

```
cproperty>
   <name>dfs.namenode.name.dir
  <value>file:///data1/cloudera/dfs/nn,file:///data2/cloudera/dfs/nn</value>
</property>
property>
  <name>dfs.blocksize</name>
  <value>268435456
</property>
property>
   <name>dfs.replication</name>
  <value>3</value>
</property>
cproperty>
  <name>dfs.namenode.http-address
  <value>itracXXX.cern.ch:50070</value>
</property>
```

#### Interfaces to HDFS

- Java API (DistributedFileSystem)
- C wrapper (libhdfs)
- HTTP protocol
- WebDAV protocol
- Shell Commands

However the command line is one of the simplest and most familiar

### HDFS - Shell Commands

#### There are two types of shell commands

#### **User Commands**

hdfs dfs - runs filesystem commands on the HDFS hdfs fsck - runs a HDFS filesystem checking command

#### **Administration Commands**

hdfs dfsadmin - runs HDFS administration commands

## HDFS – User Commands (dfs)

#### List directory contents

```
hdfs dfs -ls
hdfs dfs -ls /
hdfs dfs -ls -R /var
```

### Display the disk space used by files

```
hdfs dfs -du -h /
hdfs dfs -du /hbase/data/hbase/namespace/
hdfs dfs -du -h /hbase/data/hbase/namespace/
hdfs dfs -du -s /hbase/data/hbase/namespace/
```

## HDFS – User Commands (dfs)

### Copy data to HDFS

```
hdfs dfs -mkdir tdata
hdfs dfs -ls
hdfs dfs -copyFromLocal tutorials/data/geneva.csv tdata
hdfs dfs -ls -R
```

#### Copy the file back to local filesystem

```
cd tutorials/data/
hdfs dfs -copyToLocal tdata/geneva.csv geneva.csv.hdfs
md5sum geneva.csv geneva.csv.hdfs
```

# HDFS – User Commands (acls)

#### List acl for a file

```
hdfs dfs -getfacl tdata/geneva.csv
```

### List the file statistics – (%r – replication factor)

```
hdfs dfs -stat "%r" tdata/geneva.csv
```

#### Write to hdfs reading from stdin

```
echo "blah blah" | hdfs dfs -put - tdataset/tfile.txt hdfs dfs -ls -R hdfs dfs -cat tdataset/tfile.txt
```

# HDFS – User Commands (fsck)

### Removing a file

```
hdfs dfs -rm tdataset/tfile.txt
hdfs dfs -ls -R
```

#### List the blocks of a file and their locations

```
hdfs fsck /user/cloudera/tdata/geneva.csv -
files -blocks -locations
```

### Print missing blocks and the files they belong to

```
hdfs fsck / -list-corruptfileblocks
```

### HDFS – Adminstration Commands

### Comprehensive status report of HDFS cluster

hdfs dfsadmin -report

#### Prints a tree of racks and their nodes

hdfs dfsadmin -printTopology

### Get the information for a given datanode (like ping)

hdfs dfsadmin -getDatanodeInfo
localhost:50020

### HDFS – Advanced Commands

#### Get a list of namenodes in the Hadoop cluster

hdfs getconf -namenodes

#### Dump the NameNode fsimage to XML file

```
cd /var/lib/hadoop-hdfs/cache/hdfs/dfs/name/current
hdfs oiv -i fsimage_000000000000003388 -o
/tmp/fsimage.xml -p XML
```

The general command line syntax is

hdfs command [genericOptions] [commandOptions]

### Other Interfaces to HDFS

#### **HTTP Interface**

```
http://quickstart.cloudera:50070
```

#### MountableHDFS - FUSE

```
mkdir /home/cloudera/hdfs
sudo hadoop-fuse-dfs dfs://quickstart.cloudera:8020
/home/cloudera/hdfs
```

Once mounted all operations on HDFS can be performed using standard Unix utilities such as 'ls', 'cd', 'cp', 'mkdir', 'find', 'grep',
