

Hi All

Yesterday there was a presentation in the ADC Weekly meeting. The SAM tests used for Availability and Reliability of SEs are going to be changed to new gfal2 DDM-probes.

You can find the new monitoring already running at:

<http://wlcg-sam-atlas-dev.cern.ch/>

The name of the tests are:

DDM-srm-Del

DDM-srm-Get

DDM-srm-Put

and they are part of ATLAS\_CRITICAL. On July 1st these tests will become the official tests and moved to:

<http://wlcg-sam-atlas.cern.ch/>

The developers of the tests have been running checks comparing the old and the new tests. In the handful of cases where there was a significant difference in the results, sites have been contacted directly. None of those sites were from the UK.

You can find more information about the tests on the twikies (ongoing updates):

<https://twiki.cern.ch/twiki/bin/view/AtlasComputing/ATLASSAMTests>
