

FCC-hh Physics

Albert De Roeck, CERN

FCC Mini-workshop
Istanbul
11-12 March 2016

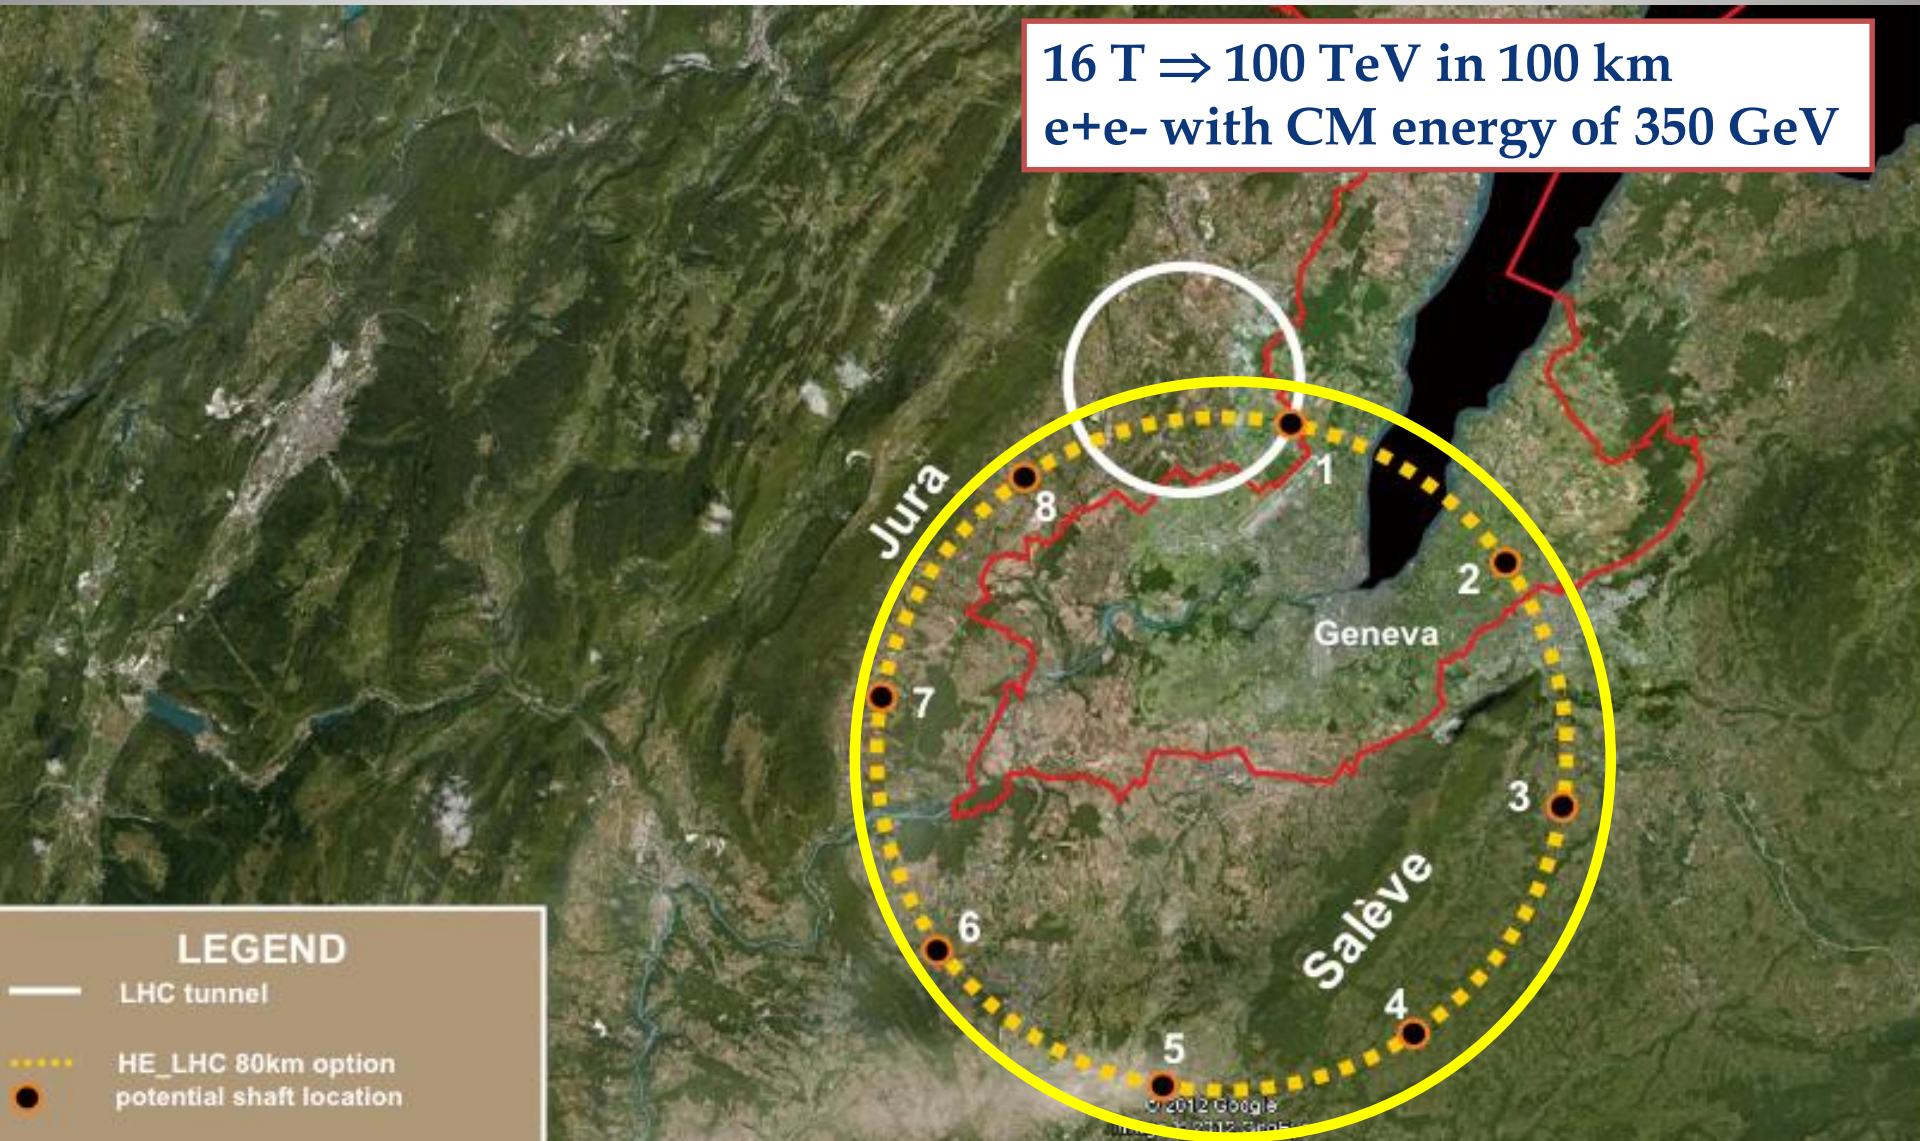

Outline

- Introduction: Experimental conditions at the FCC-hh
- Searches for massive particles
- The Higgs
- Dark Matter
- Precision measurements
- Conclusion

100 km tunnel infrastructure in Geneva area – design driven by pp-collider requirements with possibility of e^+e^- and p-e

16 T \Rightarrow 100 TeV in 100 km
 e^+e^- with CM energy of 350 GeV

Future Colliders?

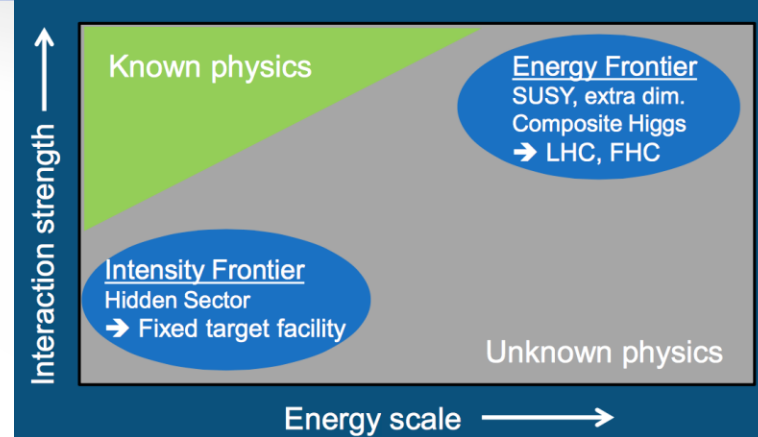

Theorist view on future colliders

FCC-hh main themes:

The study of the Higgs Boson(s)

The search for massive new physics

FCC-hh: THE machine for direct search at the higher energy scale.

FCC-hh: A New Frontier

- LHC has shown that the hadron colliders can lead to precision measurements despite high pile-up, hadron structure, underlying event, etc.
- FCC-hh will above all be a machine for high event rates and has a high mass reach for searches
- Complementarity with future e+e- machines, circular or linear that may happen before a new hadron collider
- Studies for the physics case for the FCC-hh started in 2014. Mostly theory/phenomenology studies. Lots of room for especially more experimental contributions
- **No no-loose theorem as such yet**
- Document before the next strategy meeting in 2018-2019

Physics Opportunities of a 100 TeV Proton-Proton
Collider

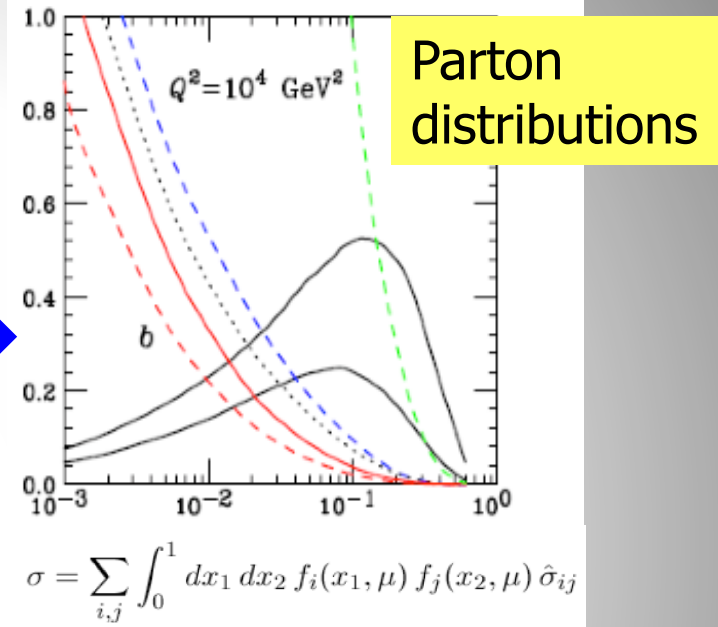

Nima Arkani-Hamed^a, Tao Han^b, Michelangelo Mangano^c, Lian-Tao Wang^d

A recent review paper
arXiv:1511.06495

pp Collisions : Complications

Protons have structure

Generic LHC Collision

pp collisions have an underlying event

Pile-up@LHC approximate 20 collisions per bunch crossing in 2012 (more in future)

Z → μμ event with ~20 reconstructed vertices (2012)

LHC & Tevatron: Precision is Possible

Standard Model Production Cross Section Measurements

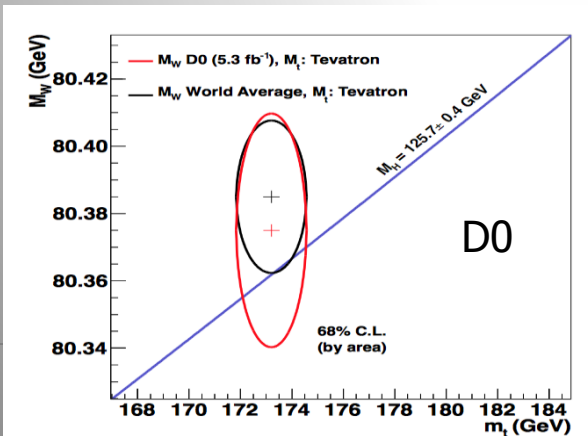

Status: Nov 2015

CMS/LHCb

$$BR(B_s \rightarrow \mu\mu) = (3.0^{+0.9}_{-0.8} \text{ (stat)}^{+0.6}_{-0.4} \text{ (syst)}) \times 10^{-9}$$

$$BR(B_d \rightarrow \mu\mu) = (3.5^{+2.1}_{-1.8} \text{ (stat+syst)}) \times 10^{-10}$$

We learned a lot from the Tevatron and in particular from the LHC

We Found a Higgs Particle @ the LHC

We know already a lot on this Brand New Higgs Particle!!

CMS: PAS-HIG-15-002
ATLAS-CONF-2015-044

Mass = CMS+ATLAS
125.09 ±0.21(stat)
±0.11(syst) GeV

Width =
A: < 24 MeV
C: < 22 MeV
(95%CL)

Couplings are
within 15-20% of
the SM values

Spin =
0⁺⁽⁺⁾ preferred
over 0⁻, 1, 2

SM-like behaviour for most properties, but continue to look for anomalies, i.e. unexpected decay modes or couplings, multi-Higgs production...

A Higgs @ 125 GeV...

A malicious choice!

$$m_H = 125.0 \pm 0.2 \text{ GeV}$$

The Higgs:
so simple yet so unnatural

Guido Altarelli
1941-2015

Stockholm Nobel Symposium
May 2013

"We do not understand why the mass of the Higgs is 125 GeV
It most likely tells us something on what is Beyond the Standard Model"

A light Higgs is "unnatural" and calls for physics beyond the SM

But where is everybody?

Eg: NO clear sign of SUSY with the data collected in run-I (similar plot for CMS)

ATLAS SUSY Searches* - 95% CL Lower Limits

Status: July 2015

Bigger than the Higgs, bigger even than gravitational waves...

It looks like the LHC may have found a surprise massive particle that gives a glimpse into a better – and entirely unexpected – theory of reality

IF IT is anything, it is what [Gian Giudice](#) has been waiting for his entire scientific life. “We are not talking about a confirmation of an established theory, but about opening a door into an unknown and unexplored world,” says Giudice, a theoretical particle physicist based at CERN near Geneva, Switzerland.

That’s if it turns out to be anything. At the moment, all we have are hints emerging from the debris of collisions within CERN’s showpiece particle smasher, the [Large Hadron Collider](#). But if those hints firm up in the course of the coming weeks and months, it could be the big one. Forget the Higgs, forget even gravitational waves: 2016 could go down as the year when a new picture of nature’s fundamental workings was unveiled.

The hopes spring from two “bumps” that have appeared independently, in the same place, in the latest data from the LHC’s two big detectors, [ATLAS](#) and [CMS](#). They point to the existence of a particle that dwarfs even the [Higgs boson](#), the giver-of-mass particle discovered at CERN in July 2012.

The Higgs was a milestone, but ultimately one that marked the end of a road. It was the last particle to be found of those predicted by the standard model of particle physics. This clutch of sophisticated equations matches every experimental result to date with exquisite precision, and explains the workings of three of the fundamental forces of nature: electromagnetism and the weak and strong nuclear forces ...

A 100 TeV pp Collider: Luminosity?

LUMINOSITY GOALS FOR A 100-TeV PP COLLIDER

April 24, 2015

Abstract

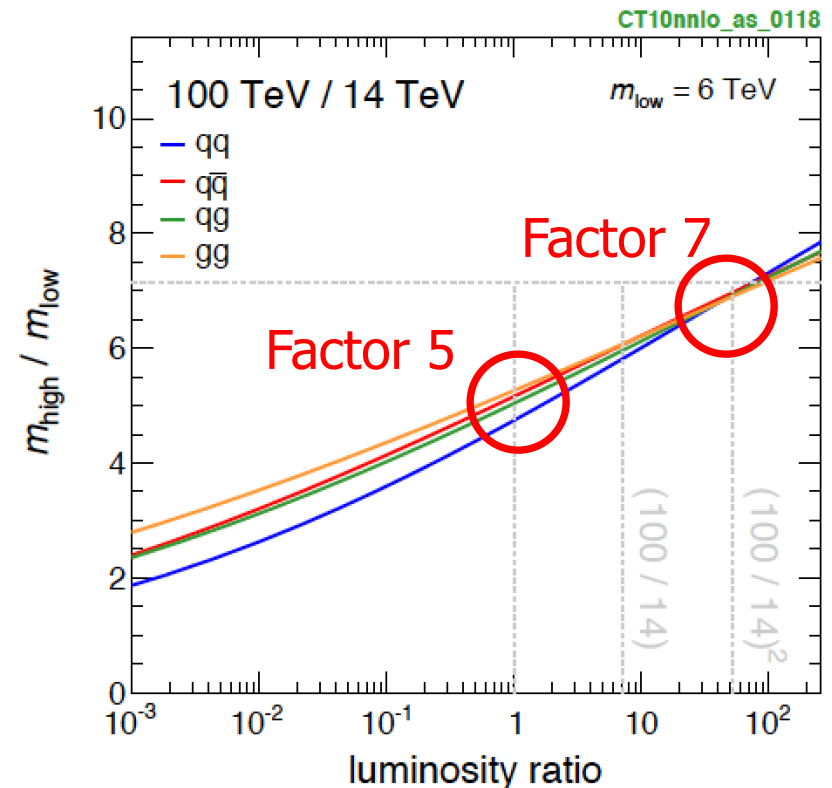

We consider diverse examples of science goals that provide a framework to assess luminosity goals for a future 100-TeV proton-proton collider.

Important discussion on luminosity: An integrated luminosity goal of 20 ab^{-1} matches very well the 100 TeV C.M. Energy

FCC-hh: Parton Luminosities

Parton luminosity ratios between 100 TeV and 14 TeV and the ratio of the reach for new physics scale from the LHC to the 100 TeV collider --compared to a LHC reach limit of 6 TeV-- vs luminosity

Generically about a factor $\sim 5-6$ increase in mass-reach w.r.t. HL-LHC

Luminosity for a Hadron Machine

The present working hypothesis is:

- peak luminosity baseline: 5×10^{34}
- peak luminosity ultimate: $\leq 30 \times 10^{34}$
- integrated luminosity baseline $\sim 250 \text{ fb}^{-1}$ (average per year)
- integrated luminosity ultimate $\sim 1000 \text{ fb}^{-1}$ (average per year)

An operation scenario with:

- 10 years baseline, leading to 2.5 ab^{-1}
- 15 years ultimate, leading to 15 ab^{-1}

would result in a **total of $O(20) \text{ ab}^{-1}$ over 25 years of operation.**

Cross Sections/Events at the FCC-hh

final state	$N_{ev}/10ab^{-1}$
W	10^{13}
t tbar	3×10^{11}
H	10^{10}
HH	10^6
jets ($p_T > 5$ TeV)	10^6
jets ($p_T > 10$ TeV)	10^4

Huge event rates, eg jets with $p_T > 10$ GeV

New Massive Particles

Searches in Dijet Production

Even with very modest luminosity one quickly bypasses the LHC sensitivity

- 1 pb⁻¹ to recover sensitivity of HL-LHC ⇒ < 1 day @ 10³²
- 50pb⁻¹ to 2x the sensitivity of HL-LHC ⇒ < 1 month @ 10³²
- 1fb⁻¹ to 3x the sensitivity of HL-LHC ⇒ < 1 year @ 2x10³²

New Boson Discovery Reach

Example: W' with SM-like couplings

NB For SM-like Z' , $\sigma_{Z'} BR_{lept} \sim 0.1 \times \sigma_{W'} BR_{lept}$, \Rightarrow rescale lum by ~ 10

At $L=O(ab^{-1})$, Lum $\times 10 \Rightarrow \sim M + 7$ TeV

FCC-hh: Searches for New Particles

Searches for pair produced SUSY particles

FCC-hh

- Reach sparticle masses search up to about 15 TeV for gluinos and 8 TeV for stops for 3 ab^{-1}
- Excited quarks probe the structure of quarks down to $4 \times 10^{-21} \text{ m}$
- Discovery of resonances up to masses of about 40-50 TeV

E.g. 2HDM in SUSY

m_h, m_H, m_A, m_{H^\pm}

$$\tan \beta \equiv \langle \Phi_2 \rangle / \langle \Phi_1 \rangle$$

Fine tuning and naturalness: (N.Craig, BSM@100 Wshop)

$$\Delta \approx \sin^2(2\beta) \frac{m_H^2}{m_h^2}$$

$$\Delta(\tan \beta = 50) \leq 1 \rightarrow m_H \lesssim 3.1 \text{ TeV}$$

Extra H can be heavy, well above LHC reach, but cannot be arbitrarily heavy

Upper limit for higher Higgs mass in 2HDM models?

● Why 100 TeV ?

- Need for $O(100 \text{ TeV})$ in the cards since the SSC days: fully explore EWWSB, probing in particular unitarization of WW scattering at $m(WW) > \text{TeV}$, and explore dynamics well above EWWSB

Boosted Objects

Already important at the LHC now!
Will be even more so at a 100 TeV machine !

M.Pierini

Calorimeter granularity important in optimization for boosted objects

Higgs

Higgs Production @ 100 TeV

Rate comparisons at 8, 14, 100 TeV

	N_{100}	N_{100}/N_8	N_{100}/N_{14}
gg→H	16 G	4.2×10^4	110
VBF	1.6 G	5.1×10^4	120
WH	320 M	2.3×10^4	66
ZH	220 M	2.8×10^4	84
ttH	760 M	29×10^4	420
gg→HH	28 M		280

$$N_{100} = \sigma_{100\text{TeV}} \times 20 \text{ ab}^{-1}$$

$$N_8 = \sigma_{8\text{TeV}} \times 20 \text{ fb}^{-1}$$

$$N_{14} = \sigma_{14\text{TeV}} \times 3 \text{ ab}^{-1}$$

Statistical precision:

- O(100 - 500) better w.r.t Run I
- O(10 - 20) better w.r.t HL-LHC

The Higgs Self Coupling!

A key measurement for our understanding of the Higgs field potential!

in pp

Difficult measurements!!:
Evaluation till ongoing
for HL-LHC sensitivity

There are several theoretical ideas to make progress to measure the Higgs potential in detail but more experimental studies are needed to see what realistically can be done at the FCC-hh

HH Production: Prospects

Higgs selfcouplings: $pp \rightarrow HH$

- $gg \rightarrow HH$ (most promising?) , $qq \rightarrow HHqq$ (via VBF)
- Reference benchmark process: $HH \rightarrow bb \gamma\gamma$
- Goal: 5% (or better) precision for SM selfcoupling

$HH \rightarrow b\bar{b}\gamma\gamma$	Barr,Dolan,Englert,Lima, Spannowsky JHEP 1502 (2015) 016	Contino, Azatov, Panico, Son arXiv:1502.00539	He, Ren Yao arXiv:1506.03302

HH		5% ?
BR _{exo}	0.45%	<10 ⁻³ for specific channels, like H \rightarrow e μ , ...
Γ_{tot}	1%	?

A lot of room here for experimentalists (and theorists) to help us fill this table in the next 2 years...

Complementarity with the FCC-ee

High P_T Higgs Production

Large rates of high p_T produced Higgses at 100 TeV!

Higgs to bb?

Detailed experimental study needed!

Reach for $H \rightarrow bb$ at high p_T

$S/\sqrt{B} \sim 1$ at $p_{T,min} \sim 3$ TeV, but plenty of room to outsmart the QCD rate

Higgs \rightarrow bb tagging at multi-TeV ?

Dark Matter

Dark Matter

Dark Matter

M. Mangano

For ~complete discussion, see "Dark Matter at a future hadron collider" Workshop,
FNAL Dec 4-6, <http://indico.cern.ch/event/445743/>

- DM could be explained by BSM models that would leave no signature at any future collider (e.g. axions).
- More in general, no experiment can guarantee an answer to the question "what is DM?"
- Scenarios in which DM is a WIMP are however compelling and theoretically justified
- We would like to understand whether a future collider can answer more specific questions, such as:
 - do WIMPS contribute to DM?
 - can WIMPS, detectable in direct and indirect (DM annihilation) experiments, be discovered at future colliders?
 - what are the opportunities w.r.t. new DM scenarios (e.g. interacting DM, asymmetric DM,)?

Dark Matter @FCC-hh

Dark Matter Searches within SUSY Scenarios

WIMP searches at colliders

Inclusive Top Quark Production

Inclusive top quark production

- Top quark production $\sigma_{100\text{TeV}}(tt) \sim 30 \text{ nb} \sim 30 \times \sigma_{14\text{TeV}}(tt)$

LO (CT14lo): $\sigma_{\text{tot}} = 21.7 + 4.8 (22\%) - 3.6 (17\%) \text{ [nb]}$.

NLO (CT14nlo): $\sigma_{\text{tot}} = 32.1 + 3.6 (11\%) - 3.3 (10\%) \text{ [nb]}$.

NNLO (CT14nnlo): $\sigma_{\text{tot}} = 34.7 + 1.0 (2.9\%) - 1.6 (4.8\%) \text{ [nb]}$.

NNLO (NNPDF30_nnlo_as_0118): $\sigma_{\text{tot}} = 34.8 + 1.0 (2.9\%) - 1.6 (4.7\%) \text{ [nb]}$. *Mitov et al*

- \Rightarrow about 10^{12} top quarks produced in 10 ab^{-1}

- rare and forbidden top decays
- 10^{12} fully inclusive W decays, triggerable by “the other W”
 - rare and forbidden W decays
 - 3×10^{11} W \rightarrow charm decays
 - 10^{11} W \rightarrow tau decays
- 10^{12} fully charge-tagged b hadrons

Other Topics Under Study

Only a limited number of topics were discussed

- EWK radiation of W 's and opportunities
- New high mass scalar resonance sensitivity
- Production of exotic coloured states
- Production of heavy leptons
- Flavor physics opportunities
- Quadruple Higgs production and quartic couplings
- BSM Higgs searches
- EW interactions at multi-TeV (eg WW scattering)
- Coloured and neutral naturalness
- Composite Higgs, twin-Higgs... models
- Precise QCD measurements
- ...

Lots of opportunities for studies

Conclusion

- The discovery of a new scalar boson has triggered a concerted effort and study for next accelerators
- A study on the physics potential for a 100 TeV pp accelerator (FCC-hh) is ongoing. **More experimental studies would be welcome.** Report planned for 2018
- Such a machine will have **huge event rate** and **high mass reach** for direct new particle production.
- Detailed Higgs studies can be made eg: **HH production, rare Higgs decays, new high mass Higgses, ttH, etc.** Complementary to an FCC-ee
- **Extend the reach for new particles to ~ 10-50 TeV**
- There is lots of **room for blue sky thinking/ideas** for measurements and experiments at such a machine!!

To follow FCC-hh physics activities

- Register with the FCC-hh mailing list for announcements:
 - <http://simba3.web.cern.ch/simba3/SelfSubscription.aspx?groupName=fcc-experiments-hadron>
- Check agendas and contents of previous events at the following indico categories:
 - Informal meetings of all **physics** subgroups (SM, Higgs, BSM):
