

Magnetic measurements on MBHSP102

L. Fiscarelli, O. Dunkel, S. Russenschuck,
S. Izquierdo Bermudez, G. Willering, J. Feuvrier
21st July 2015

The HLumi LHC Design Study is included in the High Luminosity LHC project and is partly funded by the European Commission within the Framework Programme 7 Capacities Specific Programme, Grant Agreement 284404

Outline

- MM systems (ambient and cryogenic temperature)
- Performed measurement cycles
- Results
 - Straight section
 - TF
 - Allowed multipoles
 - Other multipoles
 - Comparison with ROXIE model
 - Comparison with MBHSP101
 - Ramp-rate dependency
 - Integral field
 - Cold/Warm correlation
- Conclusions

Measurement system 300 K

- Motor + encoder + slip-ring unit (MRU)
- Fast Digital Integrator (FDI)
- FuG low voltage power supply (40 V, 20 A)
- DCCT Hitec MACC-plus
- Search coil shafts (radius 22 mm, length 1.2 m)
- Flexible software Framework for Magnetic Measurements (FFMM)

Number of turns	(-)	256
Inner width	(mm)	13.41
Inner length	(mm)	1195.6
Groove thickness	(mm)	1.4
Magnetic surface	(m ²)	3.37
Center radius	(mm)	21.33

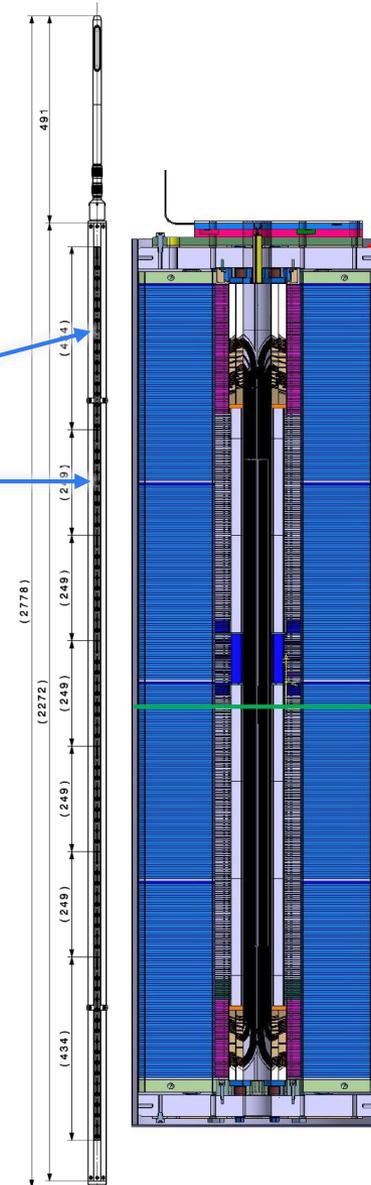

A measurement is the average over 1.2 m

Measurement system 1.9 K

- Flexible software Framework for Magnetic Measurements (FFMM)
- Fast Digital Integrators (FDI)
- Motor + encoder + slip-ring unit (MRU)
- Vertical rotating shaft in liquid He

Number of turns	-	36	36
Inner width	mm	10.3	10.3
Inner length	mm	431.5	246.5
Groove thickness	mm	0.57	0.57
Magnetic surface	m ²	0.17	0.10
Center radius	mm	21.5	21.3

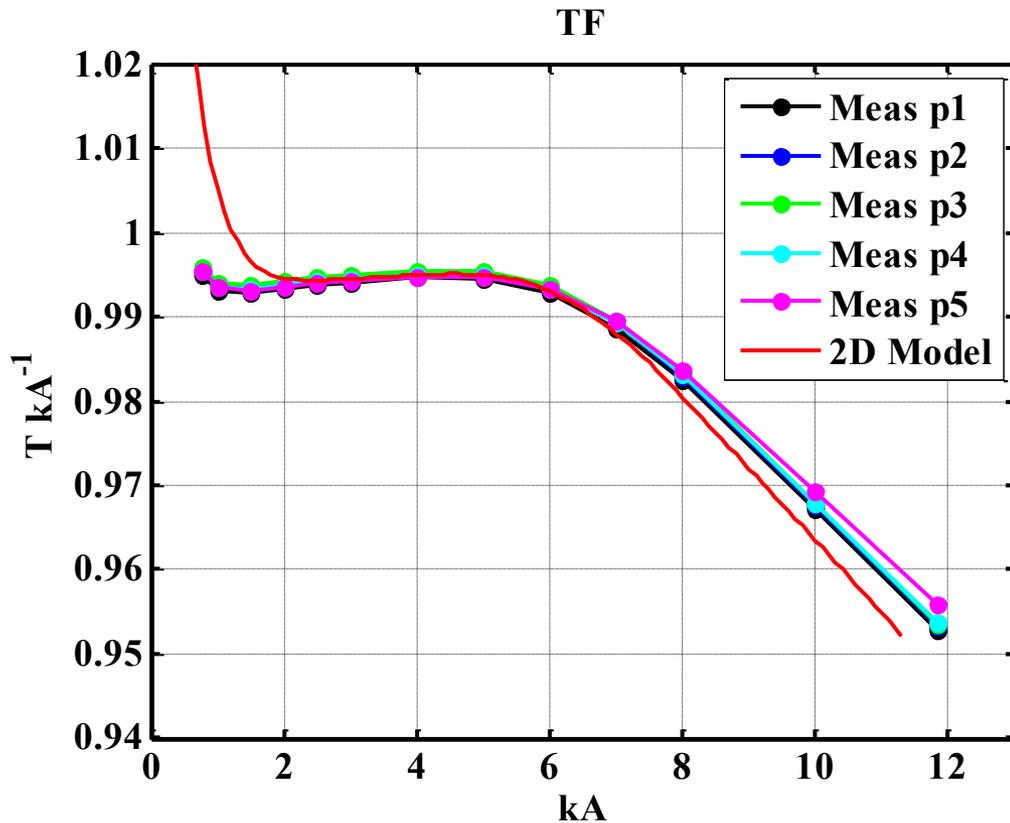

A measurement is the average over 250 mm

Performed measurement cycles

- At 1.9 K
 - Stair-step cycle
 - 3x machine simulation cycles
 - Ramp-rate study at 20, 50, and 100 A s⁻¹
 - Long flat-top (10 h) before a machine cycle
 - No measurements at 4.3 K
- } Standard program

Transfer function

- Measurements and ROXIE model in agreement for geometric TF
- Saturation overestimated by the model (+55 units)
- Measurement results on MBHSP101 and MBHSP102 are consistent

Transfer function

Possible sources of error:

Iron properties

Using data from LHC production the discrepancy decrease by 20 units (from ~70 to ~50 units)

Packing factor of the yoke laminations

Its effect is up to ~15 units

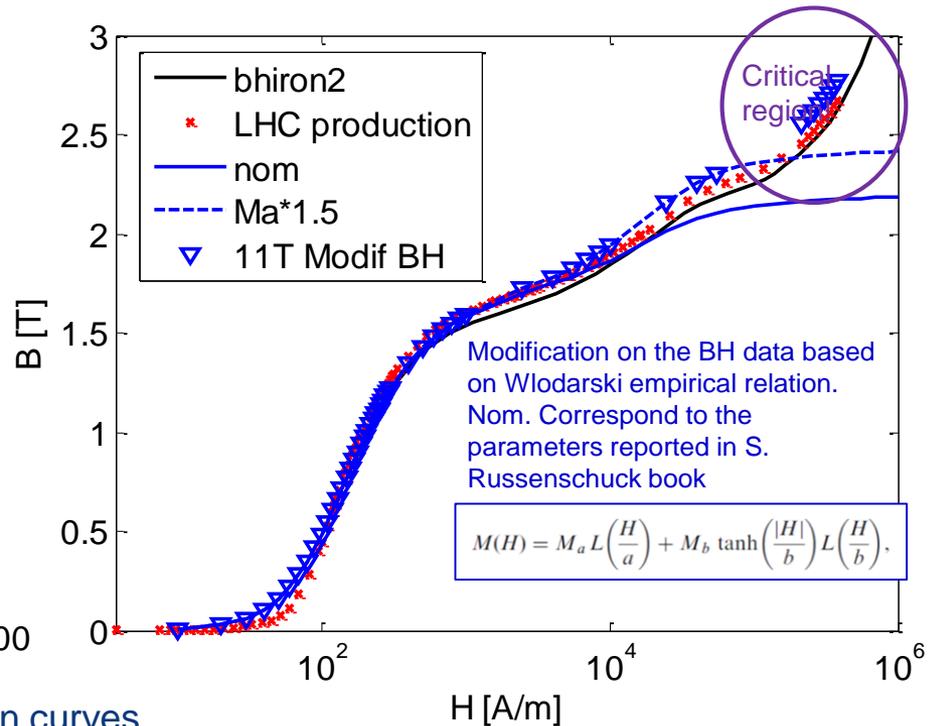

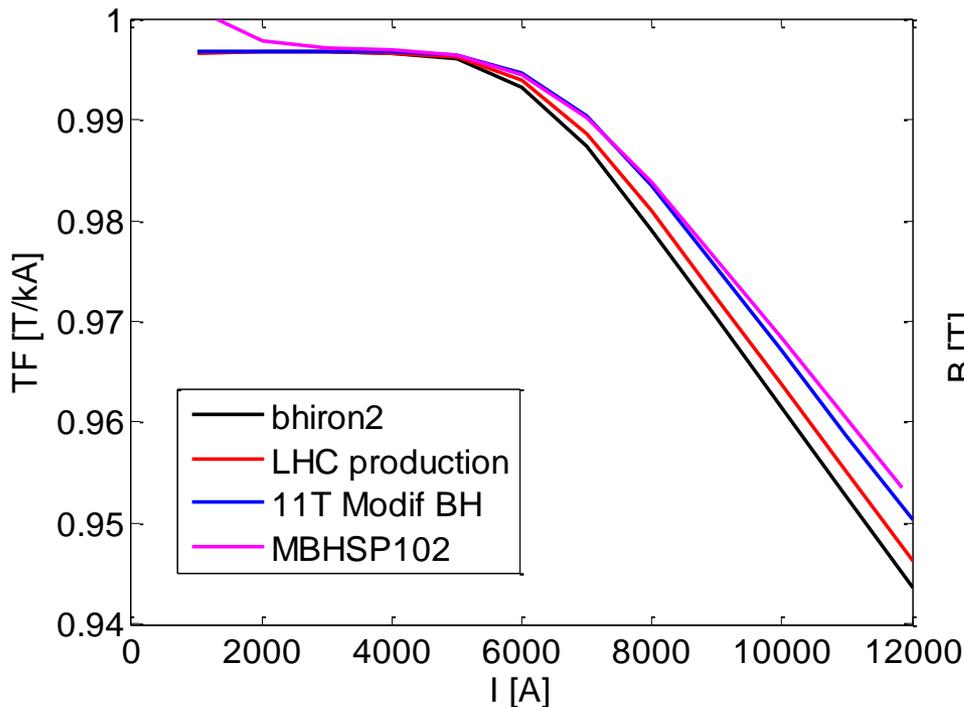

Geometric

Rather big displacements needed to explain 50 units (350 μm smaller coil gives ~15 units)

Courtesy of S. Izquierdo Bermudez

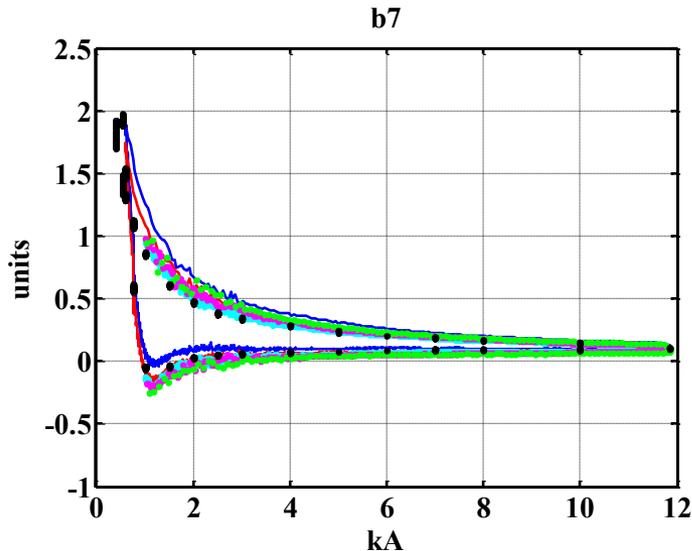

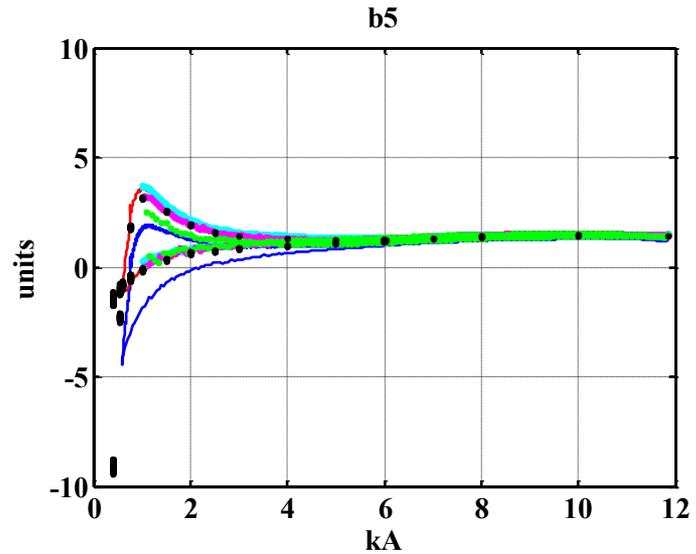

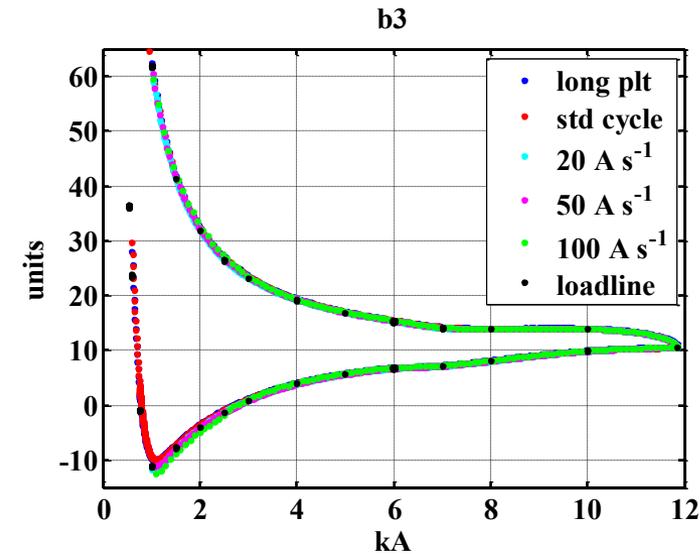

Transfer function

- The main source of error is the magnetic properties of the iron:
 - Discrepancy ~ **80 units** using ROXIE bhdata2
 - Discrepancy ~ **55 units** using LHC production data
 - Discrepancy ~ **15 units** using a modified bh data based on [1]

[1] Z. Wlodarki. Analytical description of magnetization curves

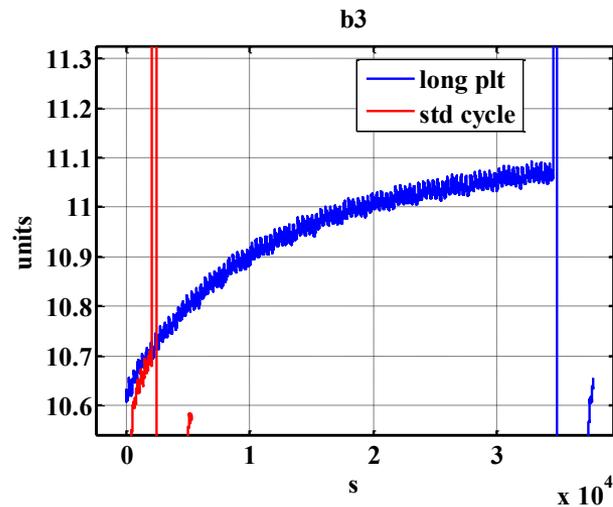

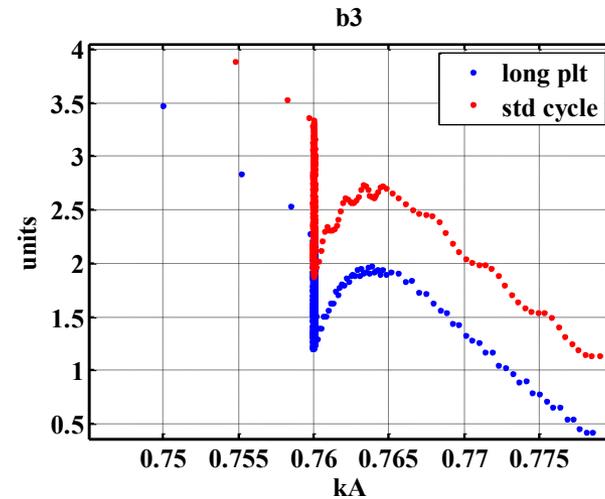

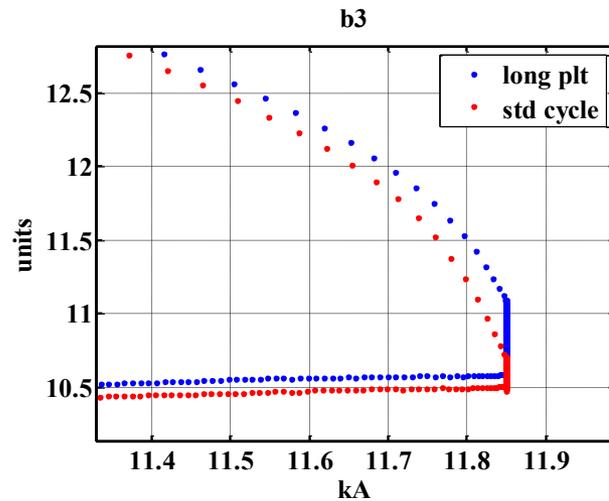

Allowed multipoles

- **b3 changes by ~22 units during ramp**
- **Offset on allowed multipoles after long plateau at nominal**

Reference radius 17 mm

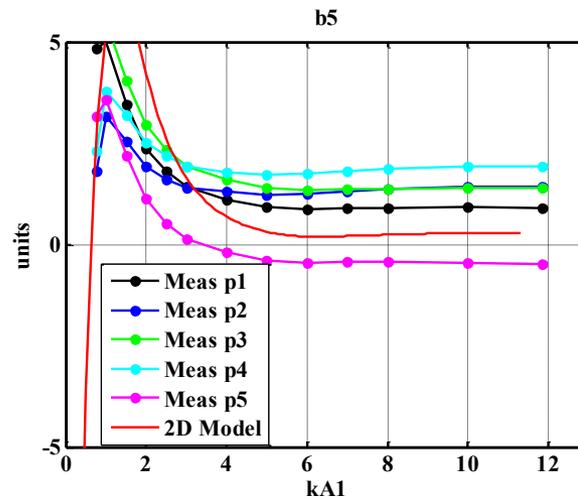

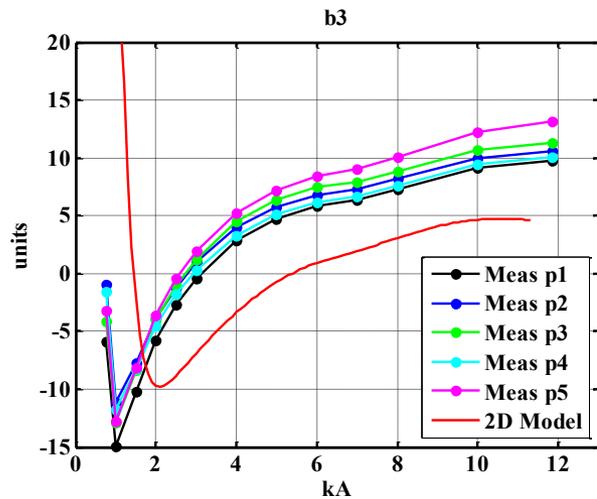

Allowed multipoles

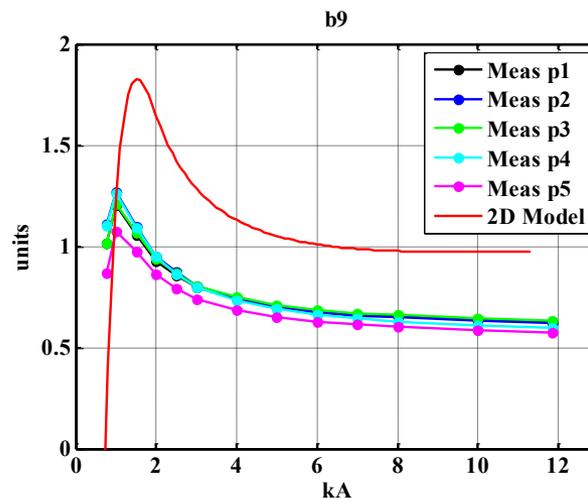

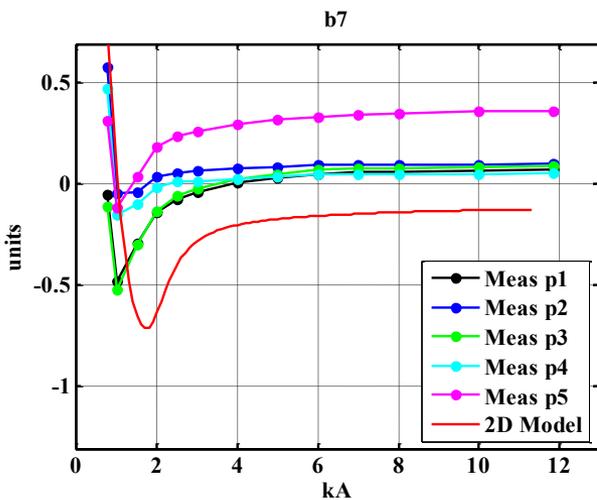

- Slow decay of b3 during long plateau at nominal ~0.5 units
- Decay at injection ~1.2 units

Reference radius 17 mm

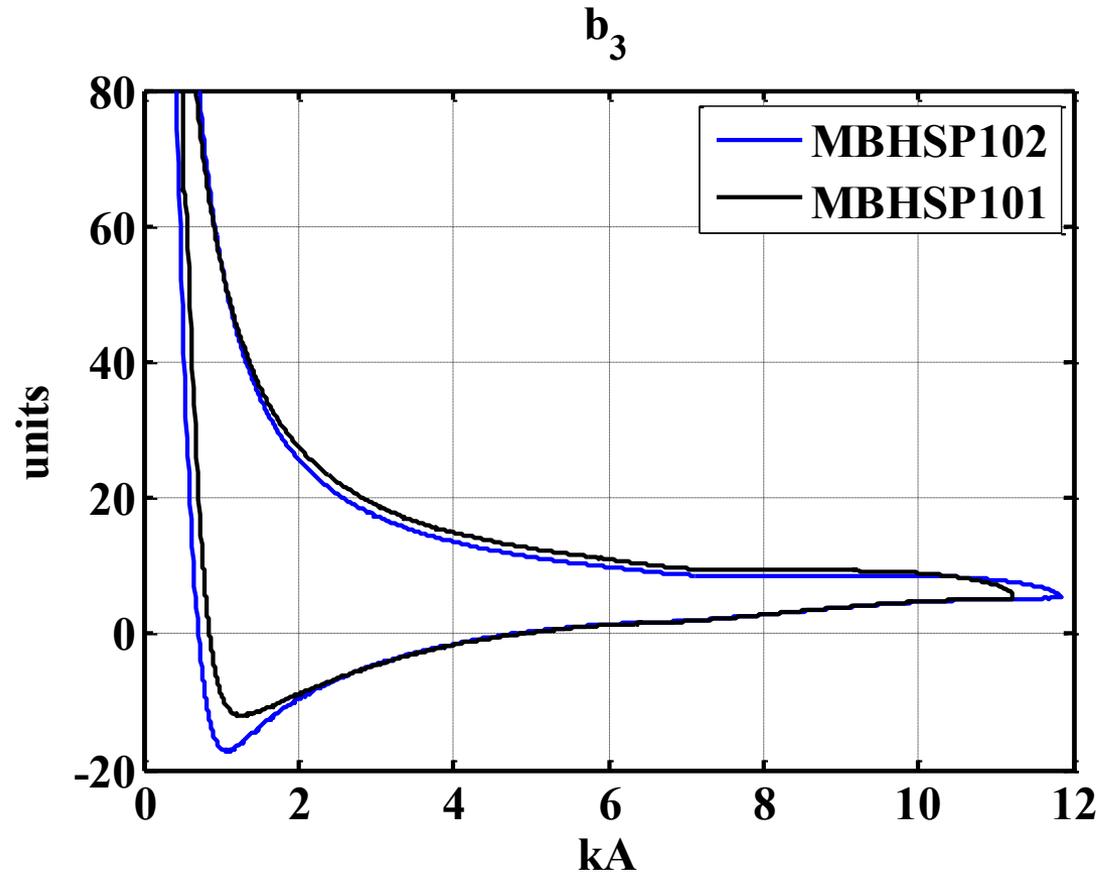

Comparison with ROXIE (2D)

- Offset of +5 units on b3
- Offset on other allowed multipoles
- Discrepancy on persistent currents

Comparison with MBHSP101

- Offset added on data from MBHSP102
- Larger persistent currents on MBHSP102

Ramp-rate dependence

		20 A s ⁻¹	50 A s ⁻¹	100 A s ⁻¹		20 A s ⁻¹	50 A s ⁻¹	100 A s ⁻¹

- Multipoles in agreement with respect to measurements at 300 K.
- Thermal contraction of measurement shaft to be checked

Reference radius 17 mm

Cold/Warm correlation

Reference radius 17 mm

Conclusions

- MBHSP102 has been tested at
 - room temperature
 - cryogenic temperature
- Comparison with model
 - TF in agreement for geometric
 - Model overestimates saturation
 - Offset on allowed multipoles
- Cold/Warm in general agreement
