Experiments' equipment directly interfering with the beam operation

Wednesday 19 January 2005 11:10 (20 minutes)

All four experimental insertion regions will be equipped with movable devices which, in some cases, have to be located very close to the beam. In addition both ALICE and LHCb use spectrometer magnets which distort the beam trajectories. Their effect therefore, has to be compensated locally with dedicated compensation magnets. The location of this experimental equipment and the signals used for its positioning will be presented. The various operation scenarios will be discussed together with the experiments' proposals for who will be responsible for these operations.
